17

18 Abstract

19 An international medical graduate (IMG) is a doctor who has received their basic medical
20 qualification from a medical school located in a different country from that in which they
21 practice or intend to practice. IMGs are known to face difficulties in their working lives,
22 including differential attainment in assessment.

23

24 The objective of this review is to map key concepts and types of evidence in academic and
25 gray literature relating to international medical graduates' experiences of clinical
26 competency assessment and to identify knowledge gaps on this topic by systematically
27 searching, selecting, and synthesizing existing knowledge.

28

29 All studies will relate to IMGs. The concept of interest will be IMGs' experiences of
30 assessment. The context will be postgraduate, licensing or credentialing medical
31 assessments of clinical competence.

32

33 This review will be conducted in accordance with the Joanna Briggs Institute (JBI)
34 methodology for scoping reviews. Seven electronic databases will be searched for literature
35 published between 2009 and 2024: the Australian Education Index, British Education Index,
36 ERIC, PubMed, PsycINFO, Scopus, and SocINDEX. Gray literature will be searched using
37 Google, Google Scholar, and published reports from postgraduate training bodies and
38 medical licensing organizations. Documents will be independently screened, selected, and
39 extracted by two researchers using a piloted data-extraction tool. Data will be analyzed and
40 presented in tables and in a narrative format.

41 **Scoping review registration:**

42 Open Science Framework: <https://osf.io/8gdm7>

43 Introduction

44 The term ‘international medical graduate’ (IMG) refers to a doctor who received their basic
 45 medical qualification from a medical school located in a different country from that in which
 46 they practice or intend to practice.^{1,2} In 2021, nearly one-fifth (19%) of doctors across OECD
 47 countries had obtained at least their basic medical qualification in another country, up from
 48 15% a decade earlier, with the percentage of foreign-trained doctors currently exceeding
 49 24% in Canada, 31% in the UK, 32% in Australia, 40% in Ireland, and 42% in New Zealand.³

51 International medical graduates often fill in gaps in healthcare provision and are more likely
 52 to work in underserved areas or in non-training service positions.^{4,5} Many studies have
 53 shown that IMGs experience adaptation difficulties when beginning to work in a new
 54 country, including professional disorientation, integration difficulties, and barriers to
 55 training entry.^{1,2,6,7} A number of recent systematic and scoping reviews have examined the
 56 evidence relating to IMGs’ integration difficulties and the discrimination they face in their
 57 working lives.^{2,6,7} Common themes included inadequate professional recognition, lack of
 58 opportunities, marginalization, subtle interpersonal exclusions, stereotypes, stigma, and
 59 favoring local graduates. While many of the issues relating to unfavorable treatment may
 60 affect IMGs’ performance and assessment outcomes, their experiences in relation to
 61 assessment were not explored in these reviews.^{2,6,7}

63 Lack of training opportunities and difficulty in passing exams are cited reasons why IMGs
 64 may be dissatisfied with work in their adopted countries.¹ There is a growing body of
 65 evidence to suggest the existence of a discrepancy in postgraduate assessment performance

66 between IMGs and locally trained graduates.^{8,9} This gap between the attainment levels of
 67 different groups of doctors is known as differential attainment.¹⁰ Differential attainment has
 68 been observed when comparing examination performance and career progression between
 69 IMGs, locally trained white doctors, and locally trained doctors from Black and Minority
 70 Ethnic groups.¹¹ It has been observed in both licensing and postgraduate examinations.^{12,13}
 71 The difference in attainment exists despite correcting for possible confounders.¹¹

72

73 Studies from the United Kingdom have revealed differential attainment in the assessments
 74 for membership of postgraduate training bodies when IMGs' performance is compared with
 75 UK graduates' performance.^{8,12,13} Differential attainment has been observed in knowledge-
 76 based multiple-choice examinations^{14,15} as well as in clinical examinations.^{8,12} An
 77 independent review in 2013 found that white UK trained candidates were four times more
 78 likely to pass the Royal College of General Practitioners (RCGP) Clinical Skills Assessment
 79 than ethnic minority UK trained candidates and 14 times more likely to pass than candidates
 80 who had trained overseas.⁸ This finding led the British Association of Physicians of Indian
 81 Origin to bring a judicial review against the RCGP and the General Medical Council (GMC)
 82 claiming discrimination.¹⁶ This judicial review found that the RCGP was neither racially
 83 discriminatory nor in breach of its public sector equality duty, but it highlighted that there
 84 was a disparity in results between different groups, and that the RCGP must take action. It
 85 concluded that "*If it [the RCGP] does not act and its failure to act is the subject of a further*
 86 *challenge in the future, it may well be that it will be held to have breached its duty*"¹⁶ [p. 9].

87

88 Similar evidence of differential attainment has been reported in the United States, Canada,
 89 Europe, and elsewhere.^{4,17-19} A study from Canada found that fewer than half of IMGs

90 passed their certification Objective Structured Clinical Examination, while almost all (93.5%)
 91 Canadian and American graduates passed.¹⁷ Similarly, a study from Sweden, of candidates
 92 taking an assessment at the end of internship, found that graduates from Swedish
 93 universities had a failure rate of less than 4% in contrast to graduates from other EU
 94 countries and non-EU graduates who failed at a rate of 21.2% and 41.6% respectively.¹⁸

95

96 The reasons for differential attainment are not fully understood. Differential attainment is
 97 still evident, even when potential confounders are considered, such as pre-university
 98 attainment and socioeconomic status²⁰ own and parents' first language, motivation for
 99 being a doctor, study habits, living arrangements (home or away), and personality.²¹

100

101 Some possible explanations for differential attainment include barriers to training that IMGs
 102 experience in their working lives, such as difficulty in accessing training positions, lack of
 103 insight into the system, lack of clarity regarding educational supervisors, discrepancies in
 104 training budgets, and access to study leave when compared with doctors in training
 105 positions.^{5,22} A GMC report from 2019 highlighted the importance of support in the working
 106 environment as a factor that promoted success in training progression. These supports
 107 included an inclusive workplace, a supportive trainer, and support to navigate the process of
 108 completing challenging professional examinations.²³

109

110 While differential attainment has been observed in knowledge-based assessment, this
 111 scoping review project will focus specifically on publications related to clinical competence
 112 assessment, including but not confined to OSCEs, workplace-based assessments, direct
 113 observation of procedures, and mini-clinical examinations. Publications related to

knowledge-based assessments only will be excluded. The rationale for this is that there are many qualitative differences between the experience of undergoing clinical competency assessment and the experience of sitting knowledge-based written examinations,²⁴ including the dynamics between candidates, examiners, real patients, and simulated patients that occur in clinical examinations but not in knowledge-based assessment. Additionally, clinical assessment mirrors the day-to-day practice of medicine more closely than knowledge-based written examinations and is therefore a very relevant measure of an IMG's adaptation and integration into a new healthcare system.

A preliminary search of PubMed, the Cochrane Database of Systematic Reviews, and *JBI Evidence Synthesis* was conducted to determine what evidence exists regarding IMGs' experiences in relation to postgraduate and medical licensing assessment. In 2015, the UK GMC commissioned a rapid review to understand differential attainment across medical training pathways.²⁵ This review found that most published studies focused on examination outcomes, such as pass/fail and progression/non-progression outcomes, and did not examine IMGs' experiences, opinions, or attitudes toward assessment. There have been no further reviews on this topic since 2015, and no systematic or scoping reviews on the topic of IMGs' experiences of clinical competency assessment were identified.

Materials and Methods

Scoping review methodology will be used. A scoping review is a method of knowledge synthesis that addresses an exploratory research question and aims to map key concepts, types of evidence, and gaps in research related to a specific field by systematically

searching, selecting, analyzing, and synthesizing existing knowledge in both peer-reviewed and gray literature.²⁶ Because the aim of this review is to address a broad research question and to map the existing academic and gray evidence related to the topic, we consider a scoping review to be the most appropriate method for this study.

The proposed scoping review will follow the PRISMA Extension for Scoping Reviews (PRISMA-ScR) reporting guidelines.²⁷ A filled PRISMA-ScR checklist can be viewed in Appendix 1. The six-step framework devised by Arksey and O'Malley²⁸ and further enhanced by Levac et al²⁹ will be used. These steps are: (i) identifying the research question, (ii) identifying relevant studies, (iii) study selection, (iv) charting the data, (v) collating, summarizing, and reporting the results, and (vi) consultation (optional). This review will be conducted in accordance with the JBI methodology for scoping reviews.³⁰

Step 1: Identifying the research questions

The objective of this scoping review is to map key concepts and types of evidence in academic and gray literature relating to IMGs' experiences of clinical competency assessment and to identify the gaps in our knowledge on this topic by systematically searching, selecting, analyzing, and synthesizing existing knowledge.

The research questions are:

1. What literature has been published relating to the experiences of international medical graduates undertaking clinical postgraduate and licensing medical examinations?

2. What experiences do international medical graduates describe in relation to clinical postgraduate and licensing medical examinations?

3. What are the gaps in the literature relating to our knowledge and understanding of international medical graduates' experiences of clinical postgraduate and licensing medical examinations?

Step 2: Identifying relevant studies

This scoping review will consider peer-reviewed and gray literature. Qualitative, quantitative, and mixed-methods studies will be included. Reports, reviews, theses, letters, book chapters, opinion pieces, and organizational documents will also be considered.

Inclusion criteria

Participants

Studies will relate to international medical graduates. For this study, IMGs will be defined as medical doctors practicing in a country other than that in which they received their basic medical qualification. Studies relating to locally trained graduates and those that do not differentiate between IMGs and locally trained graduates will be excluded. Studies related to other healthcare professionals (not medical doctors) will also be excluded.

Concept

The concept of interest will be IMGs' experiences of clinical competency assessment.

Context

The context will be postgraduate, licensing, or credentialing medical assessment that incorporates elements designed to measure clinical competence, including but not limited

to OSCEs, workplace-based assessments, direct observation of procedures, and mini-clinical examinations. Studies that relate only to knowledge-based assessments, such as multiple-choice assessments, will be excluded.

Search strategy

The search strategy will aim to identify published and unpublished studies. An initial limited search of PubMed and Scopus was carried out to become familiar with the available evidence and to identify common keywords associated with the study population and topic. Subsequently, text words, index terms, and MESH headings from relevant articles were combined to develop a full search strategy for the British Education Index, ERIC, PubMed, Psych Info, Scopus, and Soc Index. The initial search of PubMed is provided in Appendix 2. The search strategy, including all identified keywords and index terms, will be adapted for each database and/or information source. A forward and backward citation search will be conducted for all included sources of evidence to screen for additional studies.

Sources of unpublished studies or gray literature to be searched include Google, Google Scholar, and reports of relevant stakeholders, such as postgraduate medical training bodies and medical licensing organizations.

Publications from 2009 to 2024, which are available in the full text, will be considered for inclusion. This date range was chosen to allow us to include studies regarding differential attainment, which were mainly published from 2012 onwards, while bearing in mind that postgraduate and licensing examinations are regularly reviewed and updated. Therefore,

experiences from previous iterations of assessment are not relevant to the current issues faced by international medical graduates.

Step 3: Study/Source of Evidence selection

Following the search of all sources, identified citations will be collated and uploaded into the Covidence systematic review software (Veritas Health Information, Melbourne, Australia). Duplicates will be removed. A pilot test will be conducted to trial the inclusion criteria. No language restrictions will be applied. From the initial searches, we believe that the number of non-English language papers will be low. If the need arises, every effort will be made to translate relevant papers into other languages.

After the pilot, three reviewers will use the inclusion and exclusion criteria (Table 1) to screen the titles and abstracts of all citations, with two researchers independently screening each item. Thereafter, full texts will be retrieved for sources that were identified as potentially relevant, and these will be assessed in detail against the inclusion criteria by two of the three independent reviewers. Sources that do not meet the inclusion criteria for full-text review will be removed. The reasons for exclusion will be recorded and reported in the scoping review. If any disagreements arise between the reviewers at any stage of the selection process, these sources will be discussed, and if necessary, an additional reviewer or reviewers will be involved in resolving the issue. The results of the search and the study inclusion process will be documented in the final scoping review using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Review (PRISMA-ScR) flow diagram.²⁷

229

	Inclusion	Exclusion
Population	Data source relating to International Medical Graduates (medical doctors)	Sources relating to locally trained medical graduates. Sources which do not differentiate where the graduates trained. Sources relating to other health care professionals (not doctors).
Concept	Sources relating to the experiences of the participants	Sources which do not refer to the experiences of participants
Context	Sources relating to postgraduate medical examinations. Sources relating to licencing or credentialing medical examinations. Sources relating to clinical competence assessment (including but not confined to OSCEs, Workplace based assessments, Direct Observation of Procedures, Mini-Clinical Examinations)	Sources relating to undergraduate medical examinations. Sources relating only to knowledge-based assessment (e.g., MCQs)
Types of sources	Qualitative, quantitative, or mixed methods studies; 'grey' literature such as reports, reviews, theses, letters, book chapters, opinion pieces, and organisational documents. Published between 2009 - 2024.	 Published prior to 2009

230 Table 1: Inclusion and Exclusion Criteria

231

232 Step (iv): Charting the Data

233 A data extraction tool specific to the research questions will be developed and piloted by
 234 the reviewers. Three independent reviewers will use the data extraction tool to extract and
 235 record the data from the papers. The extracted data will include specific details about the

study participants, concepts, contexts, study methodologies, and key findings relevant to the review questions.

The draft extraction tool can be viewed in Appendix 3. This will be modified and revised as necessary during the process of extracting data from each of the included sources of evidence. All modifications will be described in the scoping review. To reduce the possibility of error or bias, two of the three reviewers will independently extract the data from each source. Disagreements between the reviewers will be resolved through discussion or with the involvement of an additional reviewer. In cases where essential data are lacking, the authors of the respective papers will be contacted to request the required information.

Step (v): Collating, summarizing, and reporting the results

As per the JBI Manual for Evidence Synthesis 2020 Guideline³⁰, the results will be presented as both diagrams and tables, with a descriptive summary discussing how the results relate to the review objectives and questions. The summary will also identify possible areas for further research on this topic. The results will be categorized according to the key themes identified and will relate back to the specific review objectives on the experiences of international medical graduates in relation to postgraduate and licensing clinical competency assessments.

Step (vi): Consultation

Experienced researchers will advise throughout the process including an expert in assessment who is also an international medical graduate.

259

260 This protocol has been registered and published on the Open Science Framework (available
261 at: <https://osf.io/8gdm7>)

262

263 Discussion

264

265 The strengths of this study lie in the chosen methodology. The search strategy has been
266 designed to be inclusive, with searches of multiple databases, gray literature and reports
267 from the relevant medical licensing and assessment bodies. Adhering to the JBI
268 methodological framework for scoping reviews will allow for a broad exploration of the
269 research landscape. The use of the PRISMA ScR reporting guidelines will ensure
270 transparency at all stages in the reporting process.

271

272 A potential limitation of the study may be the difficulty in obtaining translations of sources
273 that are not published in the English language. However, the researchers are based in a
274 University with a large multinational faculty and global research links and every effort will
275 be made to obtain translations of all relevant sources. As with all reviews, there is the
276 potential for publication bias in the studies included. This will be considered and discussed
277 in the final review.

278

279 The findings of this scoping review will be disseminated via peer reviewed journal
280 publication and presentation at medical conferences.

281

282 This scoping review will be part of a larger piece of work which aims to explore the issues
 283 and difficulties faced by international medical graduates in relation to clinical competency
 284 assessment. While there are published reviews of the issues faced by IMGs in relation to
 285 working and acclimatization in a new country, these do not deal specifically with issues
 286 related to assessment. This work will add to the body of existing knowledge in this field. Due
 287 to the large number of IMGs now staffing health services across the globe, we believe that
 288 this review is timely and that it has the potential to suggest ways to improve assessment for
 289 international and local medical graduates.

290

291 Acknowledgements

292 The authors acknowledge the contribution of Virginia Conrick, a librarian at University
 293 College Cork, for her assistance in devising the search strategy.

Preferred Reporting Items for Systematic reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) Checklist

SECTION	ITEM	PRISMA-ScR CHECKLIST ITEM	REPORTED ON PAGE #
TITLE			
Title	1	Identify the report as a scoping review.	Manuscript Title – Page 1
ABSTRACT			
Structured summary	2	Provide a structured summary that includes (as applicable): background, objectives, eligibility criteria, sources of evidence, charting methods, results, and conclusions that relate to the review questions and objectives.	Abstract – Page 2
INTRODUCTION			
Rationale	3	Describe the rationale for the review in the context of what is already known. Explain why the review questions/objectives lend themselves to a scoping review approach.	Page 4-7
Objectives	4	Provide an explicit statement of the questions and objectives being addressed with reference to their key elements (e.g., population or participants, concepts, and context) or other relevant key elements used to conceptualize the review questions and/or objectives.	Page 8 - 10
METHODS			
Protocol and registration	5	Indicate whether a review protocol exists; state if and where it can be accessed (e.g., a Web address); and if available, provide registration information, including the registration number.	https://osf.io/8gdm7 Page 14
Eligibility criteria	6	Specify characteristics of the sources of evidence used as eligibility criteria (e.g., years considered, language, and publication status), and provide a rationale.	Table 1 Page 12
Information sources*	7	Describe all information sources in the search (e.g., databases with dates of coverage and contact with authors to identify additional sources), as well as the date the most recent search was executed.	Search strategy - Page 10
Search	8	Present the full electronic search strategy	Appendix 2

		for at least 1 database, including any limits used, such that it could be repeated.	
Selection of sources of evidence†	9	State the process for selecting sources of evidence (i.e., screening and eligibility) included in the scoping review.	Page 11
Data charting process‡	10	Describe the methods of charting data from the included sources of evidence (e.g., calibrated forms or forms that have been tested by the team before their use, and whether data charting was done independently or in duplicate) and any processes for obtaining and confirming data from investigators.	Page 12-13
Data items	11	List and define all variables for which data were sought and any assumptions and simplifications made.	Data Extraction Tool – Appendix 3
Critical appraisal of individual sources of evidence	12	If done, provide a rationale for conducting a critical appraisal of included sources of evidence; describe the methods used and how this information was used in any data synthesis (if appropriate).	N/A
Synthesis of results	13	Describe the methods of handling and summarizing the data that were charted.	Page 13
RESULTS			
Selection of sources of evidence	14	Give numbers of sources of evidence screened, assessed for eligibility, and included in the review, with reasons for exclusions at each stage, ideally using a flow diagram.	N/A
Characteristics of sources of evidence	15	For each source of evidence, present characteristics for which data were charted and provide the citations.	N/A
Critical appraisal within sources of evidence	16	If done, present data on critical appraisal of included sources of evidence (see item 12).	N/A
Results of individual sources of evidence	17	For each included source of evidence, present the relevant data that were charted that relate to the review questions and objectives.	N/A
Synthesis of results	18	Summarize and/or present the charting results as they relate to the review questions and objectives.	N/A
DISCUSSION			
Summary of evidence	19	Summarize the main results (including an overview of concepts, themes, and types of evidence available), link to the review	N/A

		questions and objectives, and consider the relevance to key groups.	
Limitations	20	Discuss the limitations of the scoping review process.	N/A
Conclusions	21	Provide a general interpretation of the results with respect to the review questions and objectives, as well as potential implications and/or next steps.	N/A
FUNDING			
Funding	22	Describe sources of funding for the included sources of evidence, as well as sources of funding for the scoping review. Describe the role of the funders of the scoping review.	N/A

398 JBI = Joanna Briggs Institute; PRISMA-ScR = Preferred Reporting Items for Systematic
399 reviews and Meta-Analyses extension for Scoping Reviews.

400 * Where *sources of evidence* (see second footnote) are compiled from, such as bibliographic
401 databases, social media platforms, and Web sites.

402 † A more inclusive/heterogeneous term used to account for the different types of evidence
403 or data sources (e.g., quantitative and/or qualitative research, expert opinion, and policy
404 documents) that may be eligible in a scoping review as opposed to only studies. This is not
405 to be confused with *information sources* (see first footnote).

406 ‡ The frameworks by Arksey and O'Malley (6) and Levac and colleagues (7) and the JBI
407 guidance (4, 5) refer to the process of data extraction in a scoping review as data charting.

408 § The process of systematically examining research evidence to assess its validity, results,
409 and relevance before using it to inform a decision. This term is used for items 12 and 19
410 instead of "risk of bias" (which is more applicable to systematic reviews of interventions) to
411 include and acknowledge the various sources of evidence that may be used in a scoping
412 review (e.g., quantitative and/or qualitative research, expert opinion, and policy
413 document).

S3: Appendix 3

Data Extraction Tool (Continued on next page)

Scoping Review Details	
Scoping Review title:	International medical graduates' experiences of clinical competency assessment in postgraduate and licensing examinations: a scoping review protocol
Review objective/s:	The objective of this scoping review is to examine the major themes in academic and gray literature relating to international medical graduates' experiences of clinical competency assessment; and to identify the gaps in our knowledge on this topic.
Review question/s:	1. What literature has been published relating to the experiences of international medical graduates undertaking clinical postgraduate and licensing medical examinations? 2. What experiences do international medical graduates describe in relation to clinical postgraduate and licensing medical examinations? 3. What are the gaps in the literature relating to our knowledge and understanding of international medical graduates' experiences of clinical postgraduate and licensing medical examinations?
Inclusion/Exclusion Criteria	
Population	International medical graduates
Concept	Experiences of clinical competency assessment
Context	Postgraduate or licensing or credentialing medical assessment designed to measure clinical competence
Types of evidence source	• Qualitative or mixed methods studies, 'gray' literature such as reports, reviews, theses, letters, book chapters, opinion pieces, and organisational documents • Published between 2009 - 2024.
Evidence source Details and Characteristics	
Citation details (e.g., author/s, date, title, journal, volume, issue, pages)	
Country	
Context	
Participants (details e.g., age/sex and number)	
Details/Results extracted from source of evidence (in relation to the concept of the scoping review)	
Experiences described by IMGs in relation to assessment	
IMG's views on their assessments / outcomes	
Data published by postgraduate training bodies relating to IMGs and	

assessment	
Data published by medical licensing organisations relating to IMGs and assessment	
Recommendations published by postgraduate training bodies relating to IMGs and assessment	
Recommendations published by medical licensing organisations relating to IMGs and assessment
