

Covid-19 spread in Italy

H.Zheng and A.Bonasera

We monitor the second break of covid in Italy

Oct 6 is selected as the first day

The data are rescaled respect to Oct 6.

These are compared to data starting from March 14,2020
(lockdown)

Last update: November 15,2020

The data sources are:

Test number

We fit two periods:

- 1) oct 5 — Oct 19, fitting parameters: 104529,4.77396e-13,1.07542
- 2) Oct 5 — Oct 25, fitting parameters: 95483.5,3.05395e-10,1.12018

$$\#tests = m_1(t - m_2)^{m_3}$$

Check the probabilities

We fit two periods:

1) oct 5 — Oct 19, fitting parameters:

1) pos 0.0285131,0.0589282,0.149018

2) dec 0.000217757,0.000673943,0.0654084

2) Oct 5 — Oct 25, fitting parameters:

1) pos 0.0263504,0.0848655,0.104863

2) dec 0.000165612,0.011498,0.0479973

$$\Pi(t) = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}}$$

Prediction

Prediction for Nov 30, 2020

Fit oct 6 - oct 19

Pos 467071

Dec 4951

Fit oct 6 - oct 25

Pos 729496

Dec 17426

$$\#cases = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}} m_1 (t - m_2)^{m_3}$$

Extend the prediction to Dec 31st, 2020

Dec 31st
Pos 1205362
Dec 79049

$$\#cases = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}} m_1 (t - m_2)^{m_3}$$

The blue (black&red-used for the fit) points are the real data which can be compared to the prediction. Data are a little higher than our prediction, but the trend is the same. We need to see how the real data evolve in the coming days.

**Include the second stage using the same parameters of reference [1].
This assumes complete lockdown by the middle of November, similar to
March 14, 2020.**

**The deceased is not convergent yet,
needs more data**

$$\#cases = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}} m_1 (t - m_2)^{m_3}$$

Extend the prediction to Dec 31st, 2020. Adjust the number of tests since they are increasing respect to our previous fit.

Fit the period oct6-oct29
91472.1,9.94205e-12,1.13916

$$\#tests = m_1(t - m_2)^{m_3}$$

Extend the prediction to Dec 31st, 2020

Probability fit
Fit the period oct6-oct29

$$\Pi(t) = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}}$$

Extend the prediction to Dec 31st, 2020

Dec 31st
Pos 1754329
Dec 133332

$$\#cases = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}} m_1 (t - m_2)^{m_3}$$

Extend the prediction to Dec 31st, 2020

Probability fit

Fit the period oct6-nov8

Pos 0.0245332,0.152631,0.0756671

Dec 0.000157569,0.136735,0.05126

Test number fit

79634.2, 0, 1.19448

$$\Pi(t) = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}}$$

open symbols refer to data starting from March 14, 2020 (lockdown)

New prediction for Dec 31st (fit Oct 6 - Nov 8)

Positives 2498830 (no lock down) 1261352(lockdown)

Deceased 204564 (no lock down) 56107(lockdown)

Two fitting period 1) oct6-oct29 (24 days), 2) oct6-nov8 (34 days)

$$\#cases = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}} m_1 (t - m_2)^{m_3}$$

Two fitting period 1) oct6-oct29 (24 days), 2) oct6-nov8 (34 days)

$$\Pi(t) = \frac{d_0 d_\infty}{d_0 + d_\infty e^{-\gamma t}}$$

open symbols refer to data starting from March 14, 2020 (lockdown)

Two fitting periods:
1) oct6-oct29 (24 days-left panel)
2) oct6-nov8 (34 days-right panel)

Time derivative of the #cases

open symbols refer to data starting from March 14, 2020 (lockdown)

Add the study for United Kingdom

According to the actual data, we chose Sep 21 as the first day of the second wave of COVID-19 in United Kingdom.
