This counting test reports how balanced the design is in terms of frequencies. To assess how precisely this design can estimate utilities given your expected sample size, we recommend you refer to the Test Design report (the Logit Efficiency Test Using Simulated Data).

Logit Efficiency Test Using Simulated Data

Main Effects: 1 2 3 4 5 6 7

Build includes 600 respondents.

Total number of choices in each response category:

Category	Number	Percent
----------	--------	---------

1	1817	50.47%
2	1783	49.53%

There are 3600 expanded tasks in total, or an average of 6.0 tasks per respondent.

A general guideline is to achieve standard errors of 0.05 or smaller for main effect utilities and 0.10 or smaller for interaction effects or alternative-specific effects.

The strength of design for this model is 1479.71421
(The ratio of strengths of design for two designs reflects the D-Efficiency of one design relative to the other.)
