Supplementary Table 5. Longitudinal metabolomics or lipidomics studies among children in early years of life

Study	Population	Analysis	Platform	Data analysis (main)	Findings
Chiu et al ¹	Taiwan Age: 1-4 years old Sampled at 6 months, 1, 2, 3 and 4 years	Urine metabolomics	¹ H NMR	Partial least squares-based model	Higher urinary trimethylamine N-oxide (TMAO) and betaine level in children aged 6 months. Glycine and glutamine levels declined after 6 months with an increase in creatine and creatinine. Pathways associated with amino acid metabolism were different between infants aged 6 months and 1 year, whereas pathways associated with carbohydrate metabolism were different between children at ages 2 and 3 years.
Chiu et al ²	Taiwan Age: 1-4 years old Sampled at 6 months, 1, 2, 3 and 4 years	Urine metabolomics	¹ H NMR	Partial least squares-based model	Urinary metabolites are associated to the development of asthma in children
Neyraud et al ³	France Age: 3 – 11 months Sampled at 3, ~4.5, ~5.5 and 11th month	Saliva metabolomics	¹ H NMR	Partial least squares-based model ANOVA – simultaneous component analysis	Significant changes in saliva metabolome over time but was independent of milk feeding history
Giallourou et al ⁴	Peru, Bangladesh, Tanzania Age: 3 – 24 months Sampled at 3, 6, 9, 15 and 24 months for urine; 7 and 15 months for plasma	Urine and plasma metabolomics	¹ H NMR and LC-MS	Partial least squares-based model	Developed a phenome-for-age Z score (PAZ) as a measure of metabolic maturity. Growth restricted children lagged in terms of PAZ and that PAZ is predictive of length-for-age z score (a measure of linear growth).
Nikkilä et al ⁶	Finland Age: birth to 2 years	Serum lipidomics	LC-MS	Hidden Markov chains	Levels of sphingomyelins were higher in girls compared to boys in all 5 hidden Markov metabolic states,

	Sampled at 3 month intervals				indicated marked sex-based differences in lipidome progression in infants
