

1   **SUPPLEMENTARY MATERIALS**

2

3   **Characterisation of *S. argenteus* carried between healthy Royal Marines: a molecular**  
4   **epidemiology case-study to track transmission**

5

6   Elita Jauneikaite<sup>1,2\*</sup>, Bruno Pichon<sup>2,3</sup>, Mia Mosavie<sup>2</sup>, Joanne L. Fallowfield<sup>4</sup>, Trish Davey<sup>4</sup>,  
7   Neil Thorpe<sup>4</sup>, Andrew Nelstrop<sup>5,6</sup>, Shiranee Sriskandan<sup>2</sup> and Lucy E Lamb<sup>2,7,8\*</sup>

8

9

10   **Supplementary Methods**

11   **Antimicrobial susceptibility testing.** Antimicrobial susceptibility testing to erythromycin,  
12   clindamycin, mupirocin, cefoxitin and oxacillin was carried out by disk diffusion. The results  
13   were interpreted in accordance with the British Society for Antimicrobial Chemotherapy  
14   guidelines ([http://bsac.org.uk/wp-content/uploads/2012/02/Version-12-Apr-2013\\_final.pdf](http://bsac.org.uk/wp-content/uploads/2012/02/Version-12-Apr-2013_final.pdf)).

15

16   ***S. argenteus* DNA extraction.** The isolates were regrown on Columbia agar with 5% sheep  
17   blood plates (BD GmbH, Heidelberg, Germany) and incubated at 37°C overnight. Isolates  
18   were confirmed to be *S. argenteus* using the MALDI-TOF (MALDI Biotyper®, Bruker  
19   Daltonik GmbH, Germany). Overnight growth was resuspended in 100 µl of lysis buffer  
20   (100 mM NaCl, 10 mM Tris–HCl pH8, 1 mM EDTA, 1% Triton-X-100) with 20 µl of  
21   lysostaphin (1 mg/ml, Sigma, UK) and 20 µl of lysozyme (100mg/ml, Sigma, UK) incubated  
22   for 37 °C for 15 min before boiling for 10 min. Samples were centrifuged 13,000 × g for  
23   2 min and the DNA-containing supernatant was further purified using an equal volume of  
24   chloroform. DNA was precipitated with isopropanol and resuspended in ddH<sub>2</sub>O.

25

26 ***Genomic analyses***

27 **Raw read assembly and annotation.**

28 Raw sequencing reads were checked using FastQC v.0.11.2

29 (<https://www.bioinformatics.babraham.ac.uk/projects/fastqc/>). Reads were then *de novo*

30 assembled using SPAdes v. 3.10.1 [1], assembly statistics was checked using Quast v.4.5 [2].

31 Assemblies were annotated with Prokka v.1.13 [3].

32

33 **Genomic characterisation of *S. argenteus* genomes.**

34 SRST2 v0.2.0 [4] was used to determine Multi-Locus sequence type (MLST) using *S. aureus*

35 MLST database, and staphylococcal virulence factors (as per Virulence Factors of Pathogenic

36 Bacteria database, <http://www.mgc.ac.cn/VFs/>), identified potential virulence factors were

37 then double checked with blasting sequences against NCBI database. Presence of potential

38 plasmids was checked using PlasmidFinder v.2.1

39 (<http://cge.cbs.dtu.dk/services/PlasmidFinder/>, [5]). Identified contigs of potential plasmids

40 were compared to *S. aureus* plasmid p18809-P04 (NC\_018968.1) and visualised using BRIG

41 v.0.95 [6]. PHASTER (<https://phaster.ca>, [7]) was used to identify presence of phages.

42

43 **Identification of acquired antibiotic resistance genes and chromosomal mutations.**

44 SRST2 v0.2.0 [4] with ARGannot database (<https://github.com/katholt/srst2/tree/master/data>)

45 to identify acquired antimicrobial resistance genes. Chromosomal mutations associated with

46 antibiotic resistance in *gyrA*, *grlA*, *grlB* (specific mutations confer resistance to

47 ciprofloxacin), *fusA* (fusidic acid), *rpoB* (rifampin) and *dfrB* (trimethoprim) [8]; as well as

48 additional genes *pbp2*, *pfp4*, *ileS* and *23S* were checked using PointFinder database (last

49 update: 2019-07-02; [https://bitbucket.org/genomicepidemiology/pointfinder\\_db/src/master/](https://bitbucket.org/genomicepidemiology/pointfinder_db/src/master/))

50 using ResFinder 4.0 [9] available on Center for Genomic Epidemiology website  
51 (<http://www.genomicepidemiology.org>).

52  
53 **Genetic relatedness of six *S. argenteus* strains.** Pair-wise Single Nucleotide Polymorphisms  
54 (SNPs) were identified using Snippy v3.0 (<https://github.com/tseemann/snippy>) and Sarg\_A1  
55 assembly as reference and SNPs matrix was build using MEGAX v.10.2.4 [10].

56  
57 **Phylogenetic analysis and comparison to global *S. argenteus* strains.** All available *S.*  
58 *argenteus* genomes submitted to NCBI were downloaded (first downloaded on 07/08/2020,  
59 n=129; double checked on 07/02/2021, n=167) and characterised by determining MLST to  
60 select ST2250 genomes for comparative analysis. A total of 118 genomes of ST2250 *S.*  
61 *argenteus* were identified from global collection (Suppl. Table S5). SNPs for all ST2250 *S.*  
62 *argenteus* genomes were called using Snippy v3.0 (<https://github.com/tseemann/snippy>).  
63 Maximum-likelihood phylogenetic reconstruction of whole genome alignment was done  
64 using IQ-TREE v.2.0.3 [11] with best fit model “K3Pu+F+R4” (determined through extended  
65 model selection implemented in IQ-TREE) and 1000 bootstrap replicates. Phylogenetic tree  
66 was visualised using iTOL v.5 [12]. SNP pairwise distances were calculated using MEGA X  
67 v.10.2.4 [10]. Pangenome of ST2250 was analysed using Roary v.3.13.0 [13].

68 **Supplementary Tables**69 **Table S1. Accession numbers and assembly summary of six *S. argenteus* isolates.**

Isolate ID	Accession no.	Genome length	No. of contigs*	N50
Sarg_A1	ERS5455722 (SAMEA7699208)	2745379	28	244106

71 \*number of contigs longer than 500bp

72

73

74 **Table S2. Summary of Royal Marine recruits carrying *S. argenteus*. *S. argenteus* isolates  
75 are indicated in bold, the other spa-type and CC indicated for co-carried *S. aureus*.**

Recruit	Week 1	Week 6	Week 15	Week 32	Age range (yrs)	SSTI
A	t008(CC8)N	<b>t5078 (CC75)T</b> t316(CC59)N t1504(CC30)N	t015(CC45)T	x	16-20	No
B	x	x	<b>t5078 (CC75)T</b> t015(CC45)T	x	21-25	No
C	x	<b>t5078(CC75)N</b> <b>t5078(CC75)T</b>	x	x	16-20	Yes
D	<b>t5078 (CC75)N</b> <b>t5078 (CC75)T</b> t6605(CC398)T	x	t189(CC1)N	x	21-25	No

76

77

78 N – nose swab; T – throat swab; CC- clonal complex was inferred from spa-type; x – no  
79 carriage was found, or swab sample was not available.

80

81 **Table S3. Chromosomal mutations identified in genes associated with antimicrobial  
82 resistance.** None of the identified mutations were previously reported to lead to non-  
83 susceptibility to a particular antibiotic. All six *S. argenteus* strains had identical mutations  
84 identified in the genes presented in the table.

96

97 **Supplementary Figures**98 **Figure S1. Putative plasmid identified in this study from all six *S. argenteus* strains.**

99 BRIG [6] was used to present BLASTN comparisons of the whole contig of putative plasmid  
 100 of *S. argenteus* identified in this study and compared. The innermost ring shows genome  
 101 scale in kilobase pairs and subsequent rings show BLASTN comparisons. **(a)** The innermost  
 102 ring is putative plasmid contig of isolate Sarg\_A1 which is compared to the putative plasmid  
 103 contigs of other isolates in the outermost rings as follows: (1) Sarg\_B1, (2) Sarg\_C1, (3)  
 104 Sarg\_C2, (4) Sarg\_D1, (5) Sarg\_D2 and (6) annotated genes on a Sarg\_A1 putative plasmid;  
 105 non-annotated genes present hypothetical genes. **(b)** NCBI database search reported *S. aureus*  
 106 plasmid p18809-P04 (NC\_018968.1) being the closest match, but large portion of the  
 107 plasmid was missing.

108 **(a)**
