

## **SUPPLEMENTARY MATERIAL**

**Optimizing antibiotic use in Indonesia: a systematic review and synthesis of current evidence to inform opportunities for intervention**

## Table and Contents

<b>Supplementary Material</b>	<b>Page</b>
<b>Methods</b>	3
Table S1. Search terms	3
Table S2. Quality assessment criteria for study inclusion	3
<b>Results</b>	5
Table S3. Characteristics of included studies	5
Table S4. Summary of studies on antibiotic consumption based on Defined Daily Dose (DDD)	11
Figure S1. Forest plot of 20 reports on the defined daily dose (DDD) of total antibiotic use	13
Figure S2. Results of leave-one-out sensitivity analysis for meta-analysis of the defined daily dose (DDD) of total antibiotic use.	13
Figure S3. Funnel plot indicating evidence of publication bias (as shown by asymmetry) for meta-analysis of the defined daily dose (DDD) of total antibiotic use	13
Table S5. Summary of studies on appropriateness of antibiotic prescribing (according to Gyssens method)	14
Table S6. Summary of studies on appropriateness of antibiotic prescribing (according to reference guidelines)	16
Figure S4. Forest plot showing results of meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method (18 reports)	18
Figure S5. Results of leave-one-out sensitivity analysis for meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method	18
Figure S6. Results of sensitivity analysis for meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method by using alternative methods other than generalized linear mixed model (GLMM) method	18
Figure S7. Funnel plot for the meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method	19
Figure S8. Summary forest plot of 19 reports on the appropriateness of antibiotic prescribing according to the “duration” indicator in the reference guidelines	19
Figure S9. Summary forest plot of 27 reports on the appropriateness of antibiotic prescribing according to the “drug choice” indicator in the reference guidelines	20
Figure S10. Summary forest plot of 27 reports on the appropriateness of antibiotic prescribing according to the “dose” indicator in the reference guidelines	20
Figure S11. Summary forest plot of 6 reports on the appropriateness of antibiotic prescribing according to the “overall rational use” indicator in the reference guidelines	21
Figure S12. Summary forest plot of 9 reports on the appropriateness of antibiotic prescribing according to the “no contraindication/allergy label” indicator in the reference guidelines	21
Figure S13. Summary forest plot of 16 reports on the appropriateness of antibiotic prescribing according to the “indications” indicator in the reference guidelines	22
Figure S14. Summary forest plot of 13 reports on the appropriateness of antibiotic prescribing according to the “dosing frequency” indicator in the reference guidelines	22
Figure S15. Summary forest plot of 9 reports on the appropriateness of antibiotic prescribing according to the “administration route” indicator in the reference guidelines	23
Table S7. Summary of studies on knowledge, attitudes and perceptions regarding antibiotic use	24
Table S8. Summary of findings of the knowledge, attitudes and practice surveys	26
<b>Reference list of all reports included in the systematic review</b>	<b>32</b>

**Table S2.** Quality assessment criteria for study inclusion

No	Items	Antibiotic consumption	Antibiotic appropriateness	Antimicrobial stewardship	Knowledge, attitudes, practices
<b>STROBE checklist core items</b>					
1	Presents key elements of study design early in the paper (item 4)	•	•	•	•
2	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection (item 5)	•	•	•	•
3	Give the eligibility criteria, and the sources and methods of selection of participants (item 6)	•	•	•	•
4	For each variable of interest, give sources of data and details of methods of assessment (measurement) (item 8)	•	•	•	•
5	Explain how the study size was arrived at (item 10)	•	•	•	•
6	Report numbers of individuals at each stage of study—e.g., numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (item 13)	•	•	•	•
7	Give characteristics of study participants (e.g., demographic, clinical, social) and information	•	•	•	•

No	Items	Antibiotic consumption	Antibiotic appropriateness	Antimicrobial stewardship	Knowledge, attitudes, practices
	on exposures and potential confounders (item 14)				
<b>Additional theme-specific items</b>					
8	Minimum study sample size	50	50		100
9	DDD method correctly applied <sup>a</sup>	•			
10	Gyssens flowchart method correctly applied (including evaluation by at least 2 independent expert reviewers) <sup>b</sup>		•		
11	Reference prescribing guidelines specified		•		
12	Survey questionnaire/questions available in paper		•		•
13	Information that is crucial for data interpretation is missing or conflicting	•	•	•	•

Abbreviations: -, not available; ICU, intensive care unit; Ob/Gyn, Obstetrics and gynaecology

The table summarizes 20 studies on antibiotic consumption, expressed as (or converted to) Defined Daily Dose (DDD) per 100 patient-days, overall and/or for individual antibiotics, and divided by primary versus secondary/tertiary care settings. We listed the 15 antibiotics that were ranked as the top-3 most frequently used antibiotics in at least 2 studies, grouped by Access and Watch. The ATC/DDD versions used in the studies were 2003 (Hadi 2008), 2011 (Dirga 2021, Pradipta 2015, Sholih 2019), 2013 (Kusuma 2016, Trisia 2020), 2017 (Herawati 2019, Narulita 2020), 2018 (Perdaka 2020, Rachmawati 2020), 2019 (Andriani 2020) or not reported (Kartika 2019, Pratama 2019, Mahmudah 2016, Massey 2021, Muliani 2021, Putri 2021, Susanto 2019, Wikantiananda 2019, Yulia 2017).

**Figure S1.** Forest plot of 20 reports on the defined daily dose (DDD) of total antibiotic use.

**Figure S2.** Results of leave-one-out sensitivity analysis for meta-analysis of the defined daily dose (DDD) of total antibiotic use.

**Figure S3.** Funnel plot indicating evidence of publication bias (as shown by asymmetry) for meta-analysis of the defined daily dose (DDD) of total antibiotic use

**Table S5.** Summary of studies on appropriateness of antibiotic prescribing (according to Gyssens method)

The table summarizes 18 studies on the appropriateness of antibiotic prescriptions based on the Gyssens method. Gyssens evaluates the quality of each antibiotic prescription by sequentially categorizing 6 indicators from vi to i: vi=insufficient data; v=antibiotic is not indicated; iv=alternative antibiotic is available that is more effective (iva), less toxic (ivb), less costly (ivc); has narrower spectrum (ivd); iii=inappropriate duration: too long (iiia) or too short (iiib); ii=incorrect: dose (iiia), interval (iiib), route (iiic); i=incorrect timing.

The table summarizes 31 studies on appropriateness of antibiotic prescribing, based on antibiotic prescribing reference guidelines (as provided in the article), divided by primary and secondary/tertiary care settings. Appropriateness was defined by the following indicators: indication, drug choice, dose, frequency/interval, duration, and route of administration. An antibiotic prescription was classified as rational use if all indicators were scored as compliant with the reference guideline by the authors.

**Figure S4.** Forest plot showing results of meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method (18 reports)

**Figure S5.** Results of leave-one-out sensitivity analysis for meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method

**Figure S6.** Results of sensitivity analysis for meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method by using alternative methods other than generalized linear mixed model (GLMM) method.

**Figure S7.** Funnel plot for the meta-analysis on the overall appropriateness of antibiotic prescribing according to Gyssens method. The relatively symmetrical funnel plot and the non-significant Egger's test indicate that no publication bias is detected.

**Figure S8.** Summary forest plot of 19 reports on the appropriateness of antibiotic prescribing according to the “duration” indicator in the reference guidelines

**Figure S9.** Summary forest plot of 27 reports on the appropriateness of antibiotic prescribing according to the “drug choice” indicator in the reference guidelines

**Figure S10.** Summary forest plot of 27 reports on the appropriateness of antibiotic prescribing according to the “dose” indicator in the reference guidelines

**Figure S11.** Summary forest plot of 6 reports on the appropriateness of antibiotic prescribing according to the “overall rational use” indicator in the reference guidelines

**Figure S12.** Summary forest plot of 9 reports on the appropriateness of antibiotic prescribing according to the “no contraindication/allergy label” indicator in the reference guidelines

**Figure S13.** Summary forest plot of 16 reports on the appropriateness of antibiotic prescribing according to the “indications” indicator in the reference guidelines

**Figure S14.** Summary forest plot of 13 reports on the appropriateness of antibiotic prescribing according to the “dosing frequency” indicator in the reference guidelines

**Figure S15.** Summary forest plot of 9 reports on the appropriateness of antibiotic prescribing according to the “administration route” indicator in the reference guidelines

**Table S7.** Summary of studies on knowledge, attitudes and perceptions regarding antibiotic use

Abbreviations: AMR, antimicrobial resistance; DIY, Daerah Istimewa Yogyakarta; DKI, Daerah Khusus Ibukota; WHO, World Health Organization

The table summarizes 25 surveys in the domain attitudes and perceptions on antibiotic use, conducted among health care providers and communities, here organised by key emerging themes. Further details are provided in Table S5.

**Table S8.** Summary of findings of the knowledge, attitudes and practice surveys

First author	Year of publication	Year of study	Location	Study population	No. of population	Themes	Summary of findings
<b>Community</b>							
Artini <sup>76</sup>	2016	2014-2015	Denpasar, Bali	Community respondents: medical and non-medical university students	240	Antibiotic use knowledge	Both medical and non-medical students were aware that antibiotic use can drive antibiotic resistance (91.7% and 84.2%) and antibiotic cannot treat all disease (90% and 92.5%). Medical students had better knowledge than non-medical student that antibiotics aim to treat bacterial infection (90.8% versus 76.7%) and not to treat viral infection (64.2% versus 49.2%).
						Self-medication	Medical students were more likely to self-medicate (67.5%) than non-medical students (19.2%).
						Where to buy antibiotic	>90% at the pharmacy, <10% at kiosks.
						Advice to take antibiotic/ to practice self-medication	Past experience (36.5%), family (36.5%), and pharmacist (27%).
						Reasons for self-medication	Self-medication was practical (77.9%) and cheaper (13.5%), doctor is far (8.6%).
Djawaria <sup>78</sup>	2018	2014-2015	Surabaya, East Java	Community respondents buying antibiotics without a prescription at pharmacy	267	Self-medication	Majority (76%) seldom self-medicate, and 12% purchased antibiotics using a previous doctor prescription.
						Where to buy antibiotic	51.3% at the pharmacy (51.3%), 9% from family and friends; others obtained antibiotics from kiosks, previous prescriptions, or unspecified.
						Advice to take antibiotic/ to practice self-medication	Friends or family who work in the health sector (24%), family (21%), pharmacist (11%), self (6%), or friends who do not work in health sector (4%).
Fatmah <sup>79</sup>	2019	2018	Mataram, West Nusa Tenggara	Community respondents: medical and non-medical university students	400	Antibiotic use knowledge	67% of respondents used antibiotics for upper respiratory tract infection for 1-3 days as recommended by health care workers.
						Self-medication	47.5% self-medicated because it was easy to get, and many places sell antibiotics without prescriptions. Many were recommended to self-medicate by physicians or pharmacists.
						Where to buy antibiotic	88.1% respondents bought antibiotics from the pharmacy, 6.6% used the leftover antibiotics, 3.2% bought at kiosks, and 2.1% purchased at drugstores.
Fernandez <sup>80</sup>	2013	2012	Manggarai Barat, East Nusa Tenggara	Community respondents at pharmacies	108	Antibiotic use knowledge	88% knew that antibiotics treat bacterial infection; 60-65% knew that the antibiotic course must be completed, cannot treat headache and can incur side-effects when used inappropriately.
						Self-medication	All participants (100%) ever used antibiotics without a prescription. Most purchased the suggested full-course (84.2%) and kept antibiotic at home (65.7%).

First author	Year of publication	Year of study	Location	Study population	No. of population	Themes	Summary of findings
						Where to buy antibiotic	At the pharmacy (87%), got it from family (12%) or friends (1%).
						Advice to take antibiotic/ to practice self-medication	Doctor (40%), pharmacist (28%), self (18%), friends/family (8%), or brochure (6%).
						Reasons for self-medication	44.4% reported that a doctor's visit is too expensive, and 77% used the same antibiotic because it previously resulted in clinical improvement.
Fimanggar a <sup>81</sup>	2016	2013	Jatinangor, West Java	Community respondents: non-medical students	250	AMR awareness and antibiotic use knowledge	Knowledge level was poor for 56.4%, moderate for 26.4% and good for 17.2%. Misconceptions were related to taking antibiotics for common cold, taking leftover antibiotics, and antibiotics are effective to treat the same symptoms as a previous infection and to treat inflammation. Good knowledge was shown on overuse antibiotic can cause AMR, antibiotics kill bacteria, and antibiotic should be used in according with instructions.
Fitriah <sup>82</sup>	2021	2019	Banjarbaru	Community respondents	380	Antibiotic use knowledge	58.2% respondents had a good level of knowledge about antibiotic use. 98.4% had a positive attitude towards antibiotic use. Higher education ( $p=0.007$ ) and higher income ( $p=0.038$ ) was correlated with better antibiotic use knowledge.
Hamid <sup>83</sup>	2020	2019	Pangkajene and Kepulauan, South Sulawesi	Community respondents: teachers in public schools	236	Self-medication	78.4% respondents had ever used antibiotics without prescription, and 53% kept antibiotics at home for future use.
						Where to buy antibiotic	78.9% at the pharmacy, and 21.1% at kiosks.
						Advice to take antibiotic/ to practice self-medication	The highest source of information to self-medicate was relatives (38.4%), followed by pharmacists (30.3%), friends (12.4%), internet (12.4%), books (2.7%), kiosk staffs (1.6%), nurses (1.1%), midwives (0.5%), and television (0.5%).
						Reasons for self-medication	74.1% stated that previous good experience was the reason to self-medicate, and the rest mentioned no influence of previous experience.
Insany <sup>84</sup>	2015	2014	Bandung, West Java	Outpatients from 43 primary health centres and 8 pharmacies	508	Self-medication	86% respondents reported had ever practice antibiotic self-medication. Based on health belief model framework, no statistically significant was found in all 4 variables as follows: perceived benefit for not practicing self-medication ( $p=0.989$ ); perceived barrier of no obstacles to practice antibiotic self-medication in terms of drug cost and access to healthcare ( $p=0.928$ ), perception of the threat of antibiotic resistance ( $p=0.232$ ), and the self-efficacy for not practicing antibiotic self-medication ( $p=0.241$ ).
Kondoj <sup>85</sup>	2020	2019-2020	Manado, North Sulawesi	Community respondents	290	AMR awareness	43.8% respondents were aware that inappropriate use of antibiotics could lead to AMR.
						Antibiotic use knowledge	69% respondents had a low level of knowledge on antibiotic use, 14% moderate level of knowledge, and 17% had good level of knowledge.

First author	Year of publication	Year of study	Location	Study population	No. of population	Themes	Summary of findings
				buying antibiotics		Self-medication Advice to take antibiotic/ to practice self-medication	Only 20% respondents stated that they always bought antibiotics with prescriptions whereas 12.7% often, 40.6% sometimes, and 26.5% never bought antibiotics with prescriptions. 21% stated that they always self-medicated themselves according to advice from friends and relatives.
Kondoj <sup>85</sup>	2020	2018	Yogyakarta, DIY	Outpatient at clinics and pharmacies	268	AMR awareness Antibiotic use knowledge Advice to take antibiotic/ to practice self-medication	Low awareness of AMR was shown in survey as 80.7% respondents stated that AMR is only a problem for people who take antibiotic regularly, 76.9% said that AMR occurs when the body becomes resistant to antibiotics, and 55.2% were aware that overuse antibiotic can drive AMR. 91% respondent understood that antibiotics are aimed to treat bacterial infections, but 78% stated antibiotics can treat viral infections, and can be used to treat colds and cough (75%). 71% respondents agreed that internet is major source of information on antibiotics, while only 58% and 45% consider pharmacists and medical professionals respectively.
Kurniawan <sup>87</sup>	2017	2015	Manado, North Sulawesi	Community respondents at primary health centre	400	Antibiotic use knowledge Self-medication Where to buy antibiotic Advice to take antibiotic/ to practice self-medication Reasons for self-medication	Participants showed good knowledge that antibiotics kill bacteria (73%); moderate knowledge that inappropriate antibiotic use can lead to resistance (59.5%); poor knowledge related to self-medication (67.8%) and the usefulness of antibiotic i.e., for cough or runny nose (74%), does not play a role in viral infection (18%). Participants with lower level of knowledge have higher probabilities to self-medicate with antibiotics than their counterparts. Of all participants, 45% self-medicated in the past six months. 52.2% at the pharmacies and 43.9% at kiosks. Majority (70.6%) were based on own knowledge, 25.6% from family/friends. The rest from medical workers and pharmacists. Doctor visit is unpractical (55.6%) or too expensive (3.3%), participants were too busy (26.7%) and used the same antibiotic previously to treat similar symptoms (14.4%).
Novelini <sup>88</sup>	2020	2019	Padang, West Sumatra	Community respondents	100	AMR awareness Antibiotic use knowledge	54% respondents were aware that AMR may lessen the potency of antibiotics to kill the bacteria. 71.2% respondents have moderate-level knowledge on antibiotic use, with the lowest level of knowledge was found in low-education level group.
Nuraini <sup>89</sup>	2018	2017-2018	Bangkalan, East Java	Outpatients at secondary hospital	103	Antibiotic use knowledge	Based on health belief model framework, the perceived benefit of antibiotic use ( $p=0.021$ ) was statistically significant, while perceived barrier to antibiotic use ( $p=0.426$ ), perceived threat to antibiotic use ( $p=0.167$ ), and self-efficacy of antibiotic treatment ( $p=0.872$ ) were not statistically significant.

First author	Year of publication	Year of study	Location	Study population	No. of population	Themes	Summary of findings
						Adherence to treatment	Based on leftover pill counting, 55.3% completed the full antibiotic course and 44.7% did not. Participants stopped the antibiotic course because they felt better and fear of side-effects on the renal function.
<b>Pratama<sup>90</sup></b>	2018	2016	Jember, East Java	Community respondents: non-medical university students	324	Self-medication	68.5% ever used antibiotics of which 58.6% reported to purchase antibiotic without prescription. Those who have insurance were less likely to self-medicate (50%) compared to those who did not have an insurance (64%).
						Where to buy antibiotic	46.3% at the pharmacy, 12.9% at the grocery store, 12.4% from family/friends, and 10.1% at drug store.
<b>Salsabila<sup>91</sup></b>	2020	2019	Yogyakarta, DIY	Community respondents in rural and urban areas	125	AMR awareness	76.8% respondents were aware that bacteria could be resistant to antibiotics. However, 53.6% had low level of overall knowledge on antibiotic resistance.
						Antibiotic use knowledge	53.6% respondents had low level of on antibiotics use and resistance, while 46.4% had high level of knowledge.
						Advice to take antibiotic/ to practice self-medication	78.4% respondents sought healthcare professional for information on antibiotics, while 21.6% consulted internet and social media.
<b>Siahaan<sup>92</sup></b>	2017	2015	No city mentioned, West Java, DKI Jakarta, Southeast Sulawesi	Community respondents: household members	1271	Adherence to treatment	66.5% of participants took antibiotic according to doctor's instructions, and 33.9% took it only until they would feel better.
<b>Tandjung<sup>94</sup></b>	2021	2020-2021	Manado, North Sulawesi	Community respondents	323	Antibiotic use knowledge	50.5% respondents had low level of knowledge based on the response on 13 questions. 21% practiced irrational antibiotic use based on 6 indicators: information about how to use antibiotics, indication of antibiotic use, duration, dose, follow up, and dispensing.
						Self-medication	80% respondents reported ever bought antibiotics without prescriptions opposed to the rest of 20% respondents.
						Reasons for self-medication	Previous use (82%), cost-effectiveness (72%), previous similar symptoms (80%). Pharmacists allowed antibiotic purchase without prescriptions (71%).
						Advice to take antibiotic/ to practice self-medication	78% respondents used unprescribed antibiotics suggested by friends or relatives.
<b>WHO<sup>95</sup></b>	2015	2015	National	Community respondents:	1027	AMR awareness	84% were familiar with the term AMR, 68% considered antibiotic resistance is one of the biggest world problems and 67% believed that many infections are becoming resistant to antibiotics.

First author	Year of publication	Year of study	Location	Study population	No. of population	Themes	Summary of findings
				household members		Antibiotic use knowledge	66% knew what type of disease that can be treated with antibiotic, but 63% thought cold and flu could be treated with antibiotic. 76% knew they have to take the full course of antibiotic treatment. 86% thought people should use antibiotics only when they are prescribed by doctors, but 51% thought it is ok to buy the same antibiotic if it helped previously. However, 64% disapproved of using an antibiotic given by family/friend even it was aimed to treat the same illness. The majority took antibiotics in the past month (30%) and past six months (36%). In the last doctor's visit, 83% were prescribed with antibiotics; 87% got advice on how to take antibiotic.
						Where to buy antibiotic	96% at the pharmacy, 1% at stall or hawker, 1% from the internet, 1% saved up from previous time.
						Advice to take antibiotic/ to practice self-medication	83% from doctors/nurses, 15% did not get advice from doctors/nurses, and 1% could now remember.
						Antibiotic stewardship	88% stated that doctors should only prescribe antibiotics when needed, and 83% thought governments should promote the development of new antibiotics. However, the majority (75%) thought that lay people cannot do anything to stop AMR and believed that medical experts will solve the problem before it becomes too serious
Widayati <sup>96</sup>	2011	2010	Yogyakarta, DIY	Community respondents: household members	559	Self-medication	Of all participants who self-medicated, 80% had previous experience in using such antibiotics. A positive association was found between self-medication and having health insurance.
						Where to buy antibiotic	64% at the pharmacy, 19.5% at both pharmacy, drug store, and kiosk.
						Advice to take antibiotic/ to practice self-medication	Physician or pharmacist (51.2%); friends/relatives (31.7%); multiple sources (9.8%); magazine, advertising, and brochure (4.9%); and past experiences (2.4%).
						Reasons for self-medication	Reasons for self-medication were previous positive experience (54%), saving time and saving money.
Widayati <sup>97</sup>	2012	2010	Yogyakarta, DIY	Community respondents: household members	559	AMR awareness	85% have appropriate knowledge regarding antibiotic resistance, 76% about antibiotic use for bacterial infections, but 71% had incorrect knowledge regarding antibiotics for viral infections. 50% knew that antibiotics not to be used immediately for fever. Good knowledge correlated with being male, young, higher education, and higher income.
						Antibiotic use knowledge	74% believe that antibiotics can prevent illnesses from becoming worse and 40% believe antibiotic can cure any illness.

First author	Year of publication	Year of study	Location	Study population	No. of population	Themes	Summary of findings
<b>Yulia</b> <sup>98</sup>	2019	2019	Bukittinggi, West Sumatra	Community respondents	100	AMR awareness	65% respondents were aware that AMR may lessen the potency of antibiotics to kill the bacteria, while 35% respondents were not. 68% did not aware that when pathogens are resistant to one antibiotic, other antibiotics might be potent to kill the pathogen.
						Antibiotic use knowledge	40% respondents stated antibiotic can cure all disease and 67% stated antibiotic can cure fungal infection. 80% were aware that full antibiotic course must be completed and 99% aware that antibiotic must be used based on doctor's instruction.
<b>Yuliani</b> <sup>99</sup>	2014	2014	Kupang, East Nusa Tenggara	Community respondents	100	Antibiotic use knowledge	Important misconceptions: 94% thought antibiotics can treat every disease, 92% thought that every medicine is in the antibiotic group, 94% thought that every disease can be treated with antibiotics and 68% think that non-infectious disease, such as cold, fever, headache can be treated with antibiotics.
<b>Health care providers</b>							
<b>Asvinigita</b> <sup>77</sup>	2019	2019	Yogyakarta, DIY	Healthcare providers: community pharmacists	250	Antibiotic dispensing	Only 76% of pharmacists would refer the patients to physicians when symptoms are suggestive of an infection. 68% stated they would dispense antibiotic without prescriptions. Respondents had generally positive view on antimicrobial stewardship programme
<b>Siswati</b> <sup>93</sup>	2009	2000	Padang, West Sumatra	Healthcare providers	110	Antibiotic dispensing	98.8% did not respond to patients' antibiotic demand, but 12.1% gave antibiotic so the patient could leave quickly. Advice to prescribe antibiotics were obtained from community health centre doctor (33.3%), paediatricians (17.2%), and the rests were unspecified. Factors that were associated with antibiotic prescribing were level of antibiotic knowledge, attitude toward clinical guidelines, and supervision.
						Antibiotic use knowledge	54.5% participants had high knowledge and 45.5% had low knowledge. Most respondents (77.9%) never received training on rational drug use. Only 44% had other health care providers as role models in using antibiotics, while 55.6% did not.
						The use of antibiotic guideline	63.6% showed a positive attitude towards treatment guidelines, 35.4% showed a slightly positive attitude, 1% showed a slight negative attitude, and no one showed a negative attitude.
<b>Zhang</b> <sup>100</sup>	2020	2018	National	Healthcare providers (General practitioners and paediatrician s)	100	Antibiotic dispensing	Physicians stated that around 47% medical consultation led to antibiotic dispensing, with the most common age-group to receive antibiotics was 0-1year old. Physicians in Indonesia considered side effects of antibiotics as the highest consideration that detracted them from prescribing antibiotics to children. Only 19% respondents stated they would prescribe antibiotics to a 4-yo child with a 2-day history of upper respiratory tract infection. The major determinant to prescribing antibiotics was the severity of specific clinical symptoms.

Abbreviations: AMR, antimicrobial resistance; DIY, Daerah Istimewa Yogyakarta; DKI, Daerah Khusus Ibukota; WHO, World Health Organization
