

Figure S1: The levels of IgG and cytophilic antibody responses are higher compared to IgM and non-cytophilic antibodies.

(A) Comparison of IgG and IgM levels in CHMI volunteers (n=142). (B) Comparison of IgG subclass 1-4 antibody levels in CHMI volunteers. Each data point represents antibody levels for one sample in duplicates. Error bars represent the median plus 95% confidence intervals. Statistical differences between IgG and IgM were calculated using Mann-Whitney test and between subclass 1-4 antibodies using Kruskal Wallis test with Dunn's multiple comparisons test.

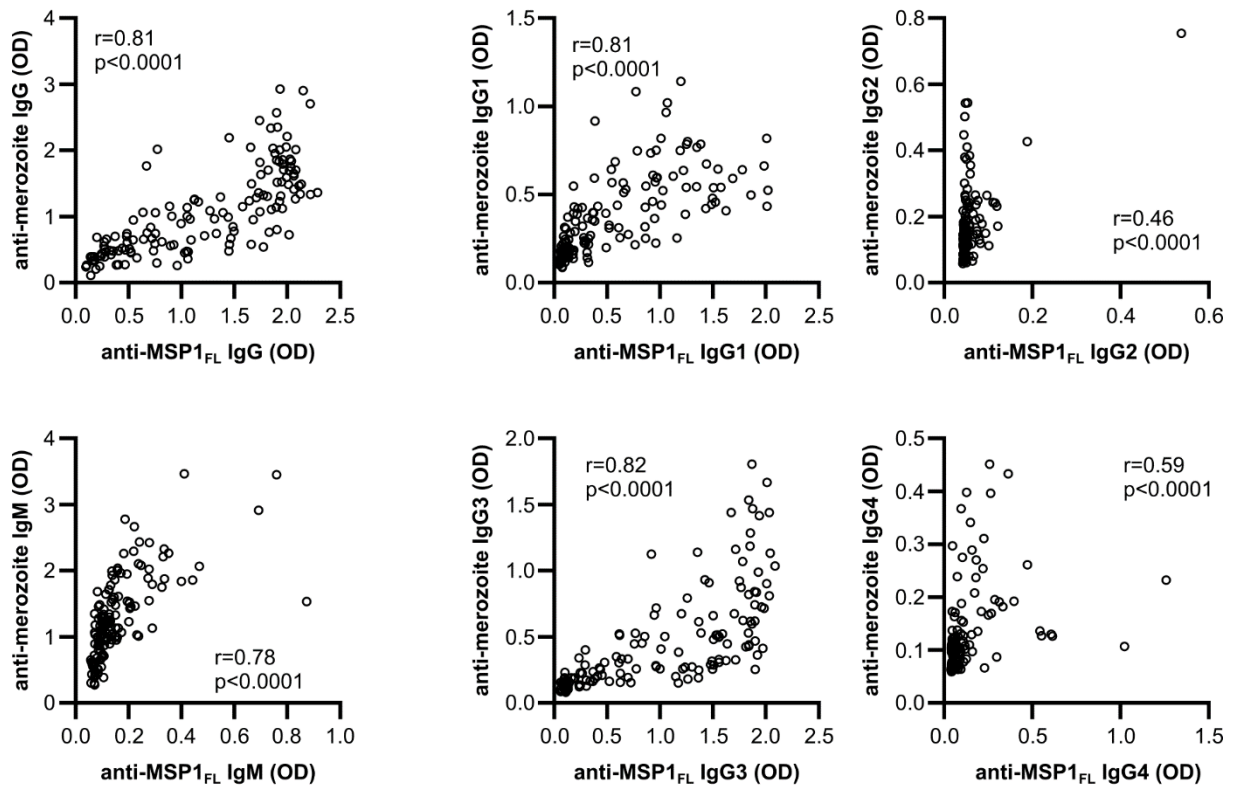

Figure S2: Antibody responses against MSP1_{FL} are correlated with responses against whole merozoites.

Spearman's correlation of anti-MSP1_{FL} and anti-merozoite IgG, IgM and IgG subclass 1-4 antibodies in CHMI volunteers (n=142). Each data point represents antibody levels for one sample in duplicates.
