The quality assessment of the microbiome measurement per study, using the STORMS (v1.03) criteria

The quanty	assessment of the initio	bliome measurement per study, using the STORMS	5 (V1.05) Citteria																
Number	ltem	Recommendation	Additional Guidance	Curtis (2019)	Cai (2021) / Zhu (2022) / Zhang (2022)	Hall (2021)	Kohn (2021)	Tillisch (2017)	Gao (2019)	Kelsey (2021)	Wang (2019) / Zheng (2020)	Dong (2022)	Dong (2020)	Strandwitz (2019)	Ahluwalia (2016)	Labus (2019)	Li (2022)	Hong (2021)	Jacobs (2021)
4,0	Laboratory methods	State the laboratory/center where laboratory work was done.	Provide a reference to complete lab protocols if previously published elsewhere such as on protocols io. Note any modifications of lab protocols and the reason for protocol modifications.	no	no	yes	yes	yes	no	yes	no	no	no	yes	no	yes	no	yes	yes
4,1	Specimen collection	State the body site(s) sampled from and how specimens were collected.	Use terms from the Uber-anatomy Ontology (https://www.ebi.ac.uk/ols/ontologies/uberon) to describe body sites in a standardized format.	yes	yes	yes	yes	yes	yes	yes	yes	no	no	yes	no	yes	yes	yes	yes
4,2	Shipping	Describe how samples were stored and shipped to the laboratory.	Include length of time from collection to receipt by the lab and if temperature control was used during shipping.	no	yes	yes	yes	yes	yes	yes	no	no	no	yes	no	yes	yes	yes	yes
4,3	Storage	Describe how the laboratory stored samples, including time between collection and storage and any preservation buffers or refrigeration used.	State where each procedure or lot of samples was done if not all in the same place. Include reagent/lot/catalogue #s for storage buffers.	no	yes	yes	yes	yes	yes	yes	yes	yes	no	yes	no	no	yes	yes	yes
4,4	DNA extraction	Provide DNA extraction method, including kit and version if relevant.	If any DNA quantification methods were used prior to DNA amplification or at the pooling step of library preparation, state so here.	yes	yes	yes	yes	yes	yes	yes	yes	yes	no	yes	yes	yes	yes	yes	yes
4,5	Human DNA sequence depletion or microbial DNA enrichment	Describe whether human DNA sequence depletion or enrichment of microbial or viral DNA was performed.	A	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes
4,6	Primer selection	Provide primer selection and DNA amplification methods as well as variable region sequenced (if applicable).		yes	yes	no	yes	yes	yes	NA	no	yes	no	yes	yes	yes	NA	NA	yes
4,7	Positive Controls	Describe any positive controls (mock communities) if used.	If used, should be deposited under guidance provided in the 8.X items.	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used
4,8	Negative Controls	Describe any negative controls if used.	If used, should be deposited under guidance provided in the 8.X items.	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used
4,9	Contaminant mitigation and identification	Provide any laboratory or computational method used to control for or identify microbiome contamination from the environment, reagents, or laboratory.	Includes filtering of reagents and other steps to minimize contamination. It is relevant to state whether the specimens of interest have low microbial load, which makes contamination especially relevant.	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	yes	not used	not used
4,10	Replication	Describe any biological or technical replicates included in the sequencing, including which steps were replicated between them.	Replication may be biological (redundant biological specimens) or technical (aliquots taken s at different stages of analysis) and used in extraction, sequencing, preprocessing, and/or data analysis.	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used	not used
4,11	Sequencing strategy	Major divisions of strategy, such as shotgun or amplicon sequencing.	For amplicon sequencing (for example, 16S variable region), state the region selected. State the model of sequencer used.	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes
4,12	Sequencing methods	State whether experimental quantification was used (QMP/cell count based, spike-in based) or whether relative abundance methods were applied.	These include read length, sequencing depth per sample (average and minimum), whether reads are paired, and other parameters.	no	no	yes	yes	yes	no	no	no	yes	yes	yes	no	no	no	yes	yes
4,13	Batch effects	Detail any blocking or randomization used in study design to avoid confounding of batches with exposures or outcomes. Discuss any likely sources of batch effects, if known.	Sources of batch effects include sample collection, storage, library preparation, and sequencing and are commonly unavoidable in all but the smallest of studies.	no	no	no	no	no	no	no	no	no	no	no	no	no	no	no	no
