

Supplemental Information

Supplemental figures

Supplemental Figure 1: Cumulative Distribution Function plotted against consensus index. The Consensus index represents how often two samples are placed together in the same cluster. A consensus value of one indicates that the two samples are always grouped together while a value of 0 indicates that two samples are never grouped together. Percent of Ambiguous Clusters (PAC) is a measure of how much of the CDF falls between a consensus index between 0.1 and 0.9. The plot above shows that as we increase the number of clusters, it's clear that the PAC will always decrease. Hence choosing the minimal PAC will lead to a cluster size equal to the number of samples.

Intermediate vs Hypoinflammatory

Intermediate vs Hyperinflammatory

Supplemental Equation

Standardized Mean Difference

$$SMD = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{(S_1^2 + S_2^2)/2}}$$

Where \bar{X}_1 and \bar{X}_2 represent the mean of a variable of interest in group 1 and two respectively while S_1 and S_2 represent the variance.
