

Figure S1

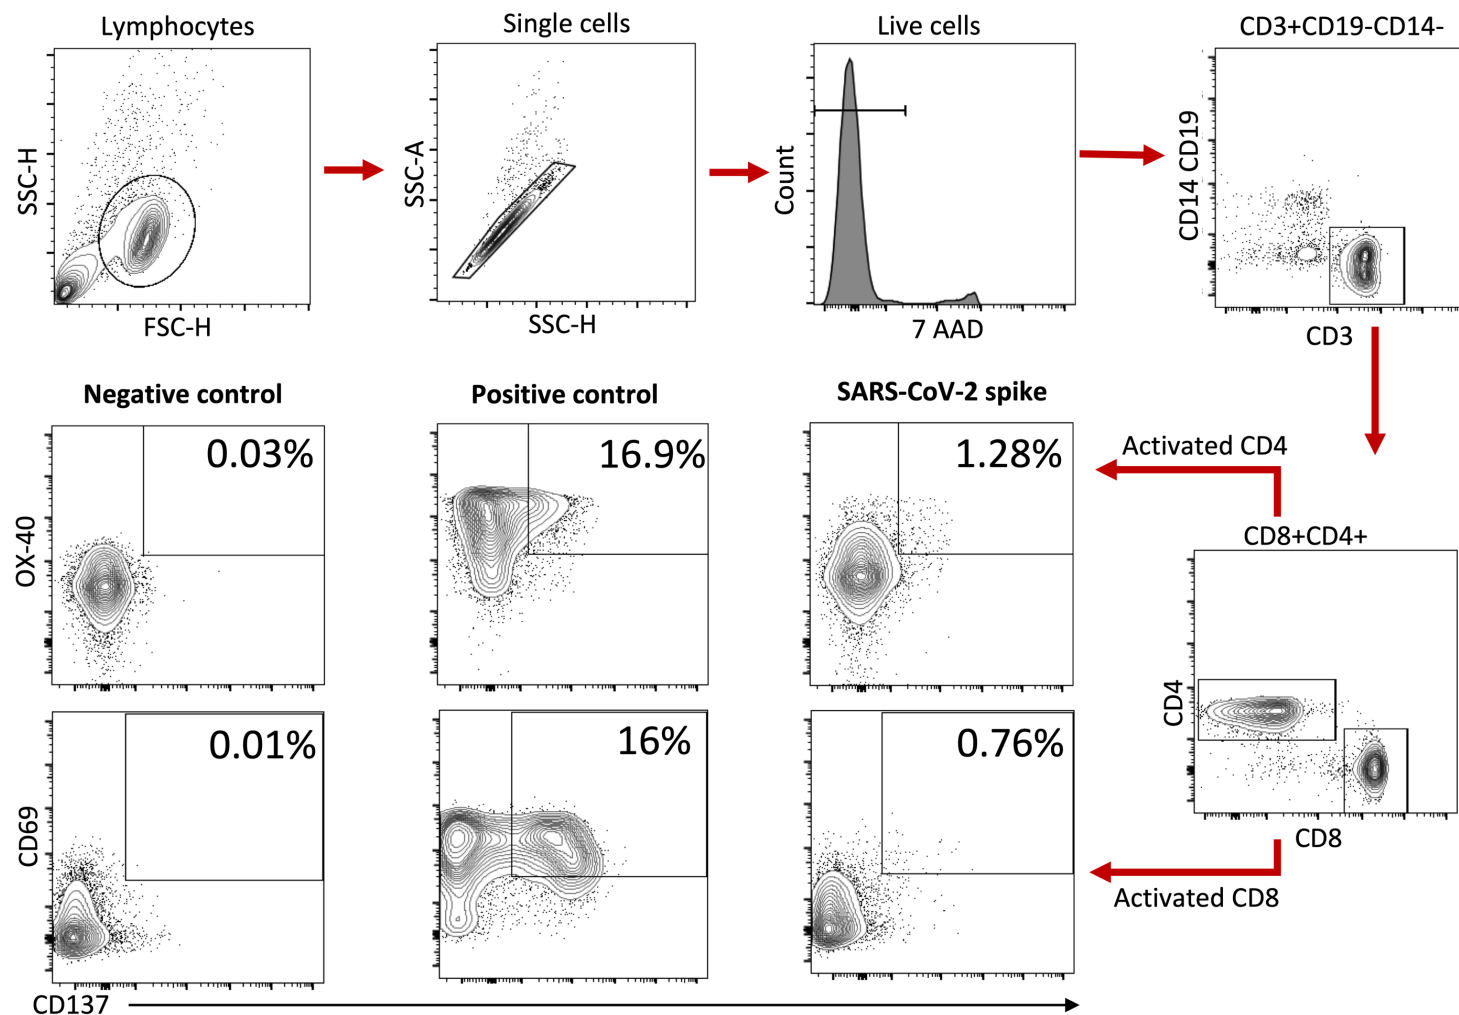

Figure S1. Gating strategy for quantification of SARS-CoV-2 Spike-specific CD4⁺ and CD8⁺ T-cells using an activation induced marker (AIM) assay.

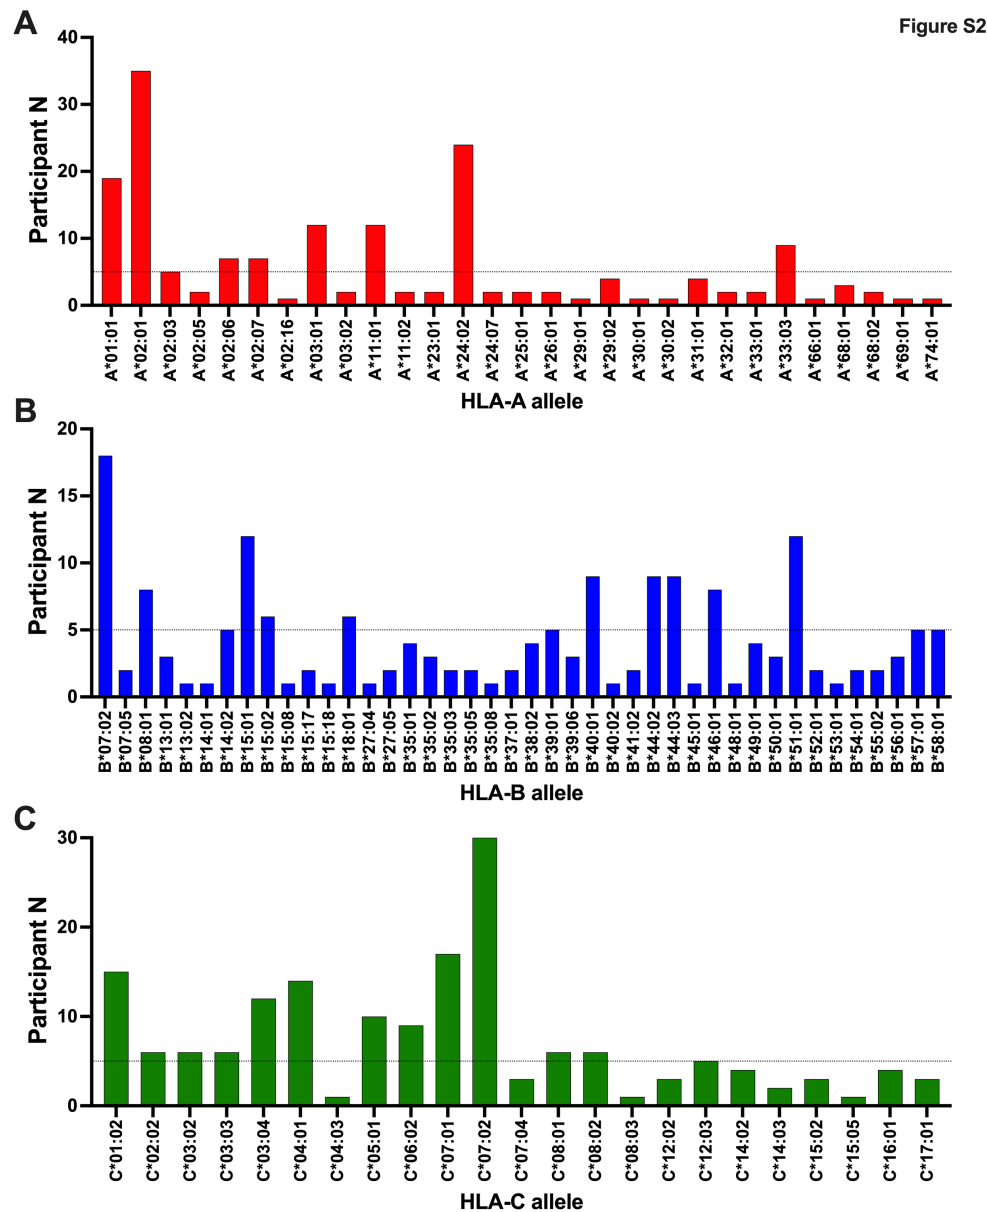

Figure S2

Figure S2. HLA-A, HLA-B and HLA-C allele frequencies, reported as the number of participants expressing each allele in the overall cohort. Alleles observed a minimum of 5 times, shown by the dotted line, were assessed for their relationship with SARS-CoV-2 Spike-specific CD8⁺ T cell frequencies post-vaccination.

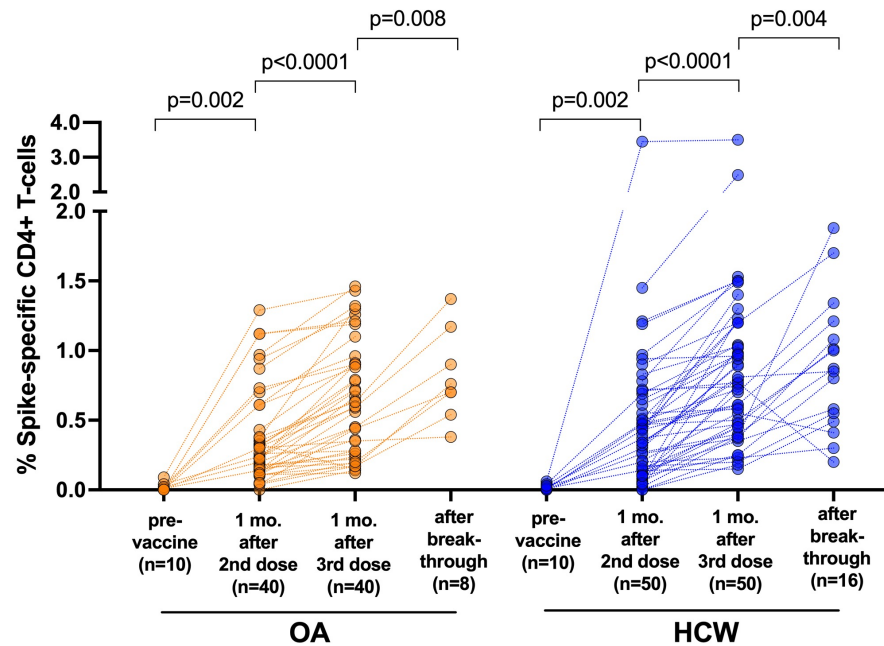

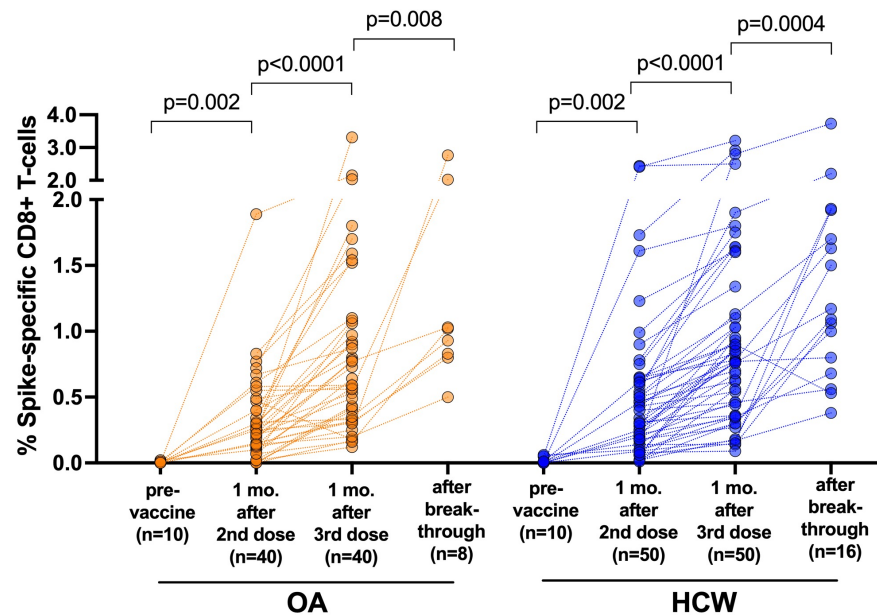

A**Figure S3****B**

Figure S3. Longitudinal view of SARS-CoV-2 Spike-specific T-cell frequencies before and after vaccination and subsequent breakthrough infection. These are the same data as shown in Figure 1, but plotted longitudinally by participant. *Panel A:* CD4+ T-cell frequencies. *Panel B:* CD8+ T-cell frequencies. Older Adults (OA) are in orange; younger Health Care Workers (HCW) are in blue. P-values are calculated using the Wilcoxon matched pairs test.
