## DESCRIPTION OF DATA AND SOURCES

### Summary of data

Table S1 presents the number of populations with available CRVS data on births and all-cause mortality by age group for 2020 and 2021 (columns 2 and 3) and the number of populations with at least 500 thousand inhabitants aged under 25 years, which were included in the primary analyses of this study (columns 4 and 5). Table S2 presents the number of countries with HMIS data included in this study.

**Table S1.** Countries and territories with available annual CRVS data on stillbirths and all-cause mortality by age and income level for the years 2020 and 2021

		Available data		Above population threshold (500K)	
		2020	2021	2020	2021
Total countries		111	71	82	55
Age at death	Stillbirths (>28w)	67	37	56	31
	Neonatal (<28d)	70	37	59	32
	Infant (<1y)	106	56	80	46
	1-4y	104	55	78	44
	0-4y	106	66	79	50
	5-9y	106	66	77	50
	10-14y	105	65	77	50
	15-19y	103	64	76	49
	20-24y	103	64	76	49
Income level	Lower-middle	13	5	12	5
	Upper-middle	35	20	28	16
	High	63	46	42	34

**Table S2.** Countries with available HMIS monthly data on stillbirths and neonatal and child mortality by income level for the years 2020 and 2021

		2020	2021
Total countries		15	15
Age at death	Stillbirths (>28w)	15	15
	Neonatal (<28d)	14	13
	0-4y	9	8
Income level	Low	10	10
	Lower-middle	5	5

## Data coverage

Figure S1-S3 presents world maps indicating the countries and territories with available CRVS or HMIS information on live births, infant deaths, and the income levels.

**Figure S1.** Countries and territories with data on births and infant deaths in 2020 and 2021

**Figure S2.** Countries and territories with data on stillbirths and neonatal deaths in 2020 and 2021

**Figure S3.** Countries and territories with data on mortality for ages 0-24 in 5-year age groups in 2020 and 2021

**Figure S4.** Countries and territories with data by income level

## METHODS

### Model for monthly baseline mortality estimation

We used monthly HMIS data to obtain excess mortality and stillbirths to include more observations. The method we used for modeling monthly data accounts for three components: 1) secular changes in mortality, 2) within-year seasonality, and 3) changes in population size and age structure over time. We obtained the baseline mortality by fitting a country- and age-specific Generalized Additive Model (GAM) to monthly death counts, using a quasi-Poisson distribution to account for overdispersion. The model is defined as

$$\log(deaths_{x,t}^c) = \beta_0 + \beta_1 t + \beta_2 m + \log(exposure_{x,t}^c),$$

where  $deaths_{x,t}^c$  and  $exposure_{x,t}^c$  indicate, respectively, the death counts and population at risk for each age group  $x$  and country  $c$ , in year  $t$ . The term  $\beta_0$  accounts for the intercept,  $\beta_1 t$ , for secular changes in mortality (as a linear trend in the logarithmic scale), and  $\beta_2 m$  for within-year seasonality.

### Examples of annual baseline mortality fitting

We present a few examples of age-specific baseline mortality fitting in four countries and all age groups in Figure S4. Excess mortality is the difference between the expected mortality in the absence of the pandemic (black line) and the observed mortality (red dots) in 2020 and 2021. P-score indexes are estimated as the relative differences and expressed in percentage values to facilitate interpretation and comparisons.

### *Stillbirths and neonatal deaths*

**Figure S5. Baseline mortality fitting by age group for all sexes combined in Colombia, South Africa, and Switzerland, using a Generalized Linear Model with overdispersion.** Black dots indicate observed annual death counts between 2015 and 2019, and colored dots indicate death counts in 2020 and 2021, indicating negative (in blue), positive (in red), or no (in purple) excess mortality. The black line depicts the fitted baseline mortality, and the gray band its bootstrapped 95% prediction interval.

**Figure S6. Baseline mortality fitting by age group for all sexes combined in Brazil, Colombia, Israel, South Africa, USA, and Uzbekistan.** The baseline mortality is obtained by fitting a Generalized Linear Model with overdispersion on observed annual death counts between 2015 and 2019 (black dots). The black line depicts the fitted baseline mortality, and the gray band its bootstrapped 95% prediction interval. Observed annual death counts for 2020 and 2021 are colored, indicating positive (in red), negative (in blue), or no (in purple) excess mortality.

## **ESTIMATES**

### **P-score estimates by age and country for CRVS data**

Figure S5 presents the country-specific p-score estimates for excess stillbirths and deaths by age and income level.

**Figure S7. Age group-specific p-score estimates by country and income level.**  
 Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., P-score = 0%). Points in blue and red indicate negative and positive changes in mortality that are statistically different from 0% ( $p < 0.05$ ), and gray points indicate changes that are not statistically different from 0% ( $p \geq 0.05$ ).

(\*) countries with available data on live births for 2020.

(\*\*) countries with available data on live births for 2020 and 2021.

**Figure S8. Age group-specific p-score estimates by country and income level.**

Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., P-score = 0%). Points in blue and red indicate negative (deficit) and positive (excess) changes in mortality, respectively, that are statistically different from 0% ( $p < 0.05$ ), and gray points indicate changes that are not statistically different from 0% ( $p \geq 0.05$ ).

(\*) countries with available data on live births for 2020.

(\*\*) countries with available data on live births for 2020 and 2021.

## Distribution of age- and country-specific p-scores by income level

**Figure S9. Distributions of p-score estimates in 2020 and 2021 by age group and income level.**  
Empty black circles indicate weighted means, full black circles population-weighted medians, and horizontal black bars indicate the 25th and 75th percentiles of the country-specific p-scores distribution.

**Figure S10. Proportions of populations according to p-score estimates in 2020 and 2021 by age group and income level.**

## Overall p-scores estimation

One important question is the overall excess mortality of the observed population, irrespective of country. Figure S11 presents the fitting of the baseline mortality by age, adding together all the deaths and at-risk populations under analysis. Likewise, in the country-specific models, these baselines were fitted to annual deaths between 2015 and 2019 using a GLM model with overdispersion, and the prediction intervals were estimated through bootstrapping.

**Figure S11. Overall baseline mortality fitting by age group for all sexes combined, using a Generalized Linear Model with overdispersion.** Black dots indicate observed annual death counts between 2015 and 2019, and colored dots death counts in 2020 and 2021 indicate negative (deficit, in blue), positive (excess, in red), or no significant difference from expected mortality (in purple). The black line depicts the fitted baseline mortality, and the gray band, its bootstrapped 95% prediction interval.

**Figure S12. Overall p-scores in 2020 and 2021 by age and income level.** Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., p-score of 0%). Numbers in parentheses indicate the percentage of the total world population considered in the analysis within each age group. Points in blue and red indicate negative (deficit) and positive (excess) changes in mortality, respectively, that are statistically different from 0% ( $p < 0.05$ ).

**Figure S13. Overall p-scores for the same countries in 2020 and 2021 by age and income level.** Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., p-score of 0%). Numbers in parentheses indicate the percentage of the total world population considered in the analysis within each age group. Points in blue and red indicate negative (deficit) and positive (excess) changes in mortality, respectively, that are statistically different from 0% ( $p < 0.05$ ).

## SENSITIVITY ANALYSES

### Sensitivity test on population size

The p-score index, as any other relative measure, is highly sensitive to mortality changes in small populations. We included all available data, regardless of population size, to test how sensitive our estimates are to including small populations. Table S4 presents the number of countries and territories with available data and those where the fitting produced robust estimates.

**Table S4.** Countries and territories with available data and with robust baseline estimates on stillbirths and all-cause mortality by age and income level for years 2020 and 2021

		Available data		Robust Fitting	
		2020	2021	2020	2021
Total countries		111	71	104	68
Age at death	Stillbirths (>28w)	67	37	64	37
	Neonatal (<28d)	70	37	68	37
	Infant (<1y)	106	56	100	54
	1-4y	104	55	91	50
	0-4y	106	66	100	63
	5-9y	106	66	85	54
	10-14y	105	65	88	56
	15-19y	103	64	92	57
	20-24y	103	64	92	59
Income level	Lower-middle	13	5	13	5
	Upper-middle	35	20	34	20
	High	63	46	57	43

Using this threshold for population size, 27% (354 of 1,303) of age group-country combinations were excluded in this robustness check. Figure S13 depicts the weighted p-scores (circles) and the p-score values range (rhombus) for each age group in 2020 and 2021 when all countries are included (in black) and when countries with small populations are excluded (in red). As shown in **Fig. S14**, the truncation of combinations with small populations had an effect on the extreme values but not on the weighted average or the 25th and 75th p-score percentiles.

**Figure S14. Weighted p-score averages (circles) and p-score values range (asterisks) by age and year.** Circles indicate p-score averages in each age and year. Whiskers depict the 25th and 75th percentiles of p-score values in each age-year configuration. Summary measures of estimates that include all countries are depicted in black, and those excluding countries with small populations (<500K) are in red.

### Sensitivity test on fitting time resolution

Mortality data is available in weekly, monthly, and annual configurations. In this section, we test how sensitive excess estimates are to using different time-scale configurations in mortality data. Figure S15 presents the excess estimates obtained from weekly and annual mortality data. In both cases, we fit a Generalized Additive Model (GAM) with quasi-Poisson distribution to deaths between 2015 and 2019. Both models use a log-linear trend for the secular trend in mortality and the population at risk as an offset. The model for weekly data also includes a cyclic p-spline to account for within-year seasonality. Prediction intervals in both cases were estimated through bootstrapping with 1,000 iterations.

We find a negligible difference between excess estimates based on weekly or annual death counts in the countries where we have information in both time scales. On

average, estimates based on annual deaths had a 0.07% lower p-score than estimates based on weekly deaths.

**Figure S15. Sensitivity analysis of p-score and its prediction interval according to different time scales.**

### Sensitivity test on previous years

This analysis allows us to evaluate whether the pattern in mortality changes observed in years 2020 and 2021 result from stochastic changes that would have been observed in any given year. For this purpose, we evaluate excess mortality estimates for 2017, 2018, and 2019. We estimate the baseline mortality based on the previous five years in each case (e.g., period 2012-2016 for estimating excess in 2017), using the same GLM model with quasi-Poisson distribution applied for estimating the 2020 and 2021 baselines. We then compute p-scores by country, age, and year and calculate the proportion of countries with negative and positive variations in mortality.

Figure S16 shows the distribution of p-scores for all years between 2017 and 2021, using the same set of **75** countries and territories for each year.

**Figure S16. Distribution of p-scores by population, age, and income level for all years between 2017 and 2021.** Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., P-score = 0%). Bars in blue and red indicate the proportion of countries and territories with significant negative and positive changes in mortality, and purple bars indicate the proportion of countries and territories where changes were not statistically different from 0%.

Figure S17 presents the age-specific overall p-score estimates for each year between 2017 and 2021 for the total population under observation and by income level. Figure S18 shows these estimates but restricts the analysis to countries with data for all periods.

**Figure S18. Overall p-score estimates by age and income level for all years between 2017 and 2021.** Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., P-score = 0%). Points in blue and red indicate negative (deficit) and positive (excess) changes in mortality, respectively, that are statistically different from 0% ( $p < 0.05$ ), and gray points indicate changes within the prediction interval.

**Figure S19. Overall p-score estimates by age and income level for all years between 2017 and 2021.** Vertical dashed lines indicate no change in mortality relative to the expected value (i.e., P-score = 0%). Points in blue and red indicate negative (deficit) and positive (excess) changes in mortality, respectively, that are statistically different from 0% ( $p < 0.05$ ) and gray points indicate changes within the prediction interval.

## TABLES WITH COUNTRY-SPECIFIC INFORMATION

### Data availability by country

Table S3 presents detailed information for each country regarding the periods with available data on live births, stillbirths, and mortality among neonates, infants, and between ages 0 and 24.

**Table S3.** List of the countries and territories included in the analyses, indicating the ages observed and the years with available data on stillbirths and mortality of neonates, infants, and under 24y.

### Data sources by country

Table S4 presents the sources in each country from which data on live births, stillbirths, neonatal, infant, and under-25 mortality was obtained.

**Table S4.** List of the populations included in the analyses, indicating the sources of information on stillbirths and mortality of neonates, infants, and under 24y.

Country / Territory	Measure	Source
Afghanistan	live births	Health Management Information System (HMIS)
Albania	live births	UNPD - Demographic Yearbook
American Samoa	live births	UNPD - Demographic Yearbook
Andorra	live births	UNPD - Demographic Yearbook
Antigua and Barbuda	live births	UNPD - Demographic Yearbook
Argentina	live births	UNICEF data call. Argentina Ministerio de Salud - CRVS. Data submitted to UNICEF via e-mail
Aruba	live births	UNPD - Demographic Yearbook
Australia	live births	UNICEF data call. Australian Bureau of Statistics. Vital statistics and civil registration (CRVS). <a href="https://www.abs.gov.au">https://www.abs.gov.au</a> .
