

Supplementary 2. Key Findings and Quality Assessment (N=28)

Study and Location	Key Findings	Statistical Findings	Quality Rating (Good, Fair, Poor)
Afifi et al (2016) <i>Canada</i>	<ul style="list-style-type: none"> - Child abuse exposure is more likely among military personnel compared with the general population in Canada - Child abuse exposure is associated with increased odds of suicidal ideation, suicide plans and suicide attempts among the CGP and CAF (Regular and Reserve Forces). However, the effect of child abuse exposure on suicide-related outcomes is generally stronger among the CGP compared with military personnel - Deployment-related trauma was associated with past-year suicidal ideation and suicide plans, however, in comparison, child abuse exposure was more strongly and more consistently associated with suicide-related outcomes - Prevention efforts targeting child abuse may reduce suicide-related outcomes 	<ul style="list-style-type: none"> - Child abuse exposure associated with increased odds of suicidal ideation, suicide plans, suicide attempts (range AORs 1.7 [95% CI 1.0-2.9] to 6.3 [95% CI 4.2-9.5], $p<.05$) - Deployment related trauma was associated with past-year suicidal ideation (AOR 1.4 [95% CI 1.0-1.8], $p<.05$) and suicide plans (AOR 1.7 [95% CI 1.1-2.7], $p<.05$) <i>[suicidal ideation model non-significant after further adjustment]</i> - Child abuse exposure without deployment-related trauma and child abuse exposure with deployment-related trauma <i>[Regulars]</i> were associated with increased odds of past-year suicidal ideation (AORs 2.0 [95% CI 1.3-3.0] and 2.7 [95% CI 1.8-4.2], $p<.05$) and suicide plans (AOR 2.9 [95% CI 1.4-6.0] and 4.6 [95% CI 2.3-9.2], $p<.05$) - Experiencing child abuse exposure only, relative to deployment-related trauma only <i>[Regulars]</i> was associated with increased odds of past-year suicidal ideation but not suicide plans - Experience of childhood abuse exposure and deployment-related trauma significantly increased the odds of past-year suicidal ideation and suicide plans compared with exposure to deployment-related trauma only - Deployment-related trauma without history of child abuse exposure <i>[Regulars]</i> was not associated with past-year suicidal ideation (AOR 1.2 [95% CI 0.7-1.8]) or suicide plans (AOR 2.9 [95% CI 0.8-4.3]) 	Fair
Belik et al (2009) <i>Canada</i>	<ul style="list-style-type: none"> - Exposure to combat or peacekeeping operations was not significantly associated with an increased risk of suicide attempts - Sexual and other interpersonal traumas are highly associated with suicide attempts in both men and women currently active in the Canadian military - Increasing levels of traumatic exposure are associated with further increased likelihood of suicide attempts in this population 	<p>Males:</p> <ul style="list-style-type: none"> - Deployment-related traumatic events: <ul style="list-style-type: none"> *Combat (range AORs 1.25 [95% CI 0.70-2.21] and 1.15 [95% CI 0.62-2.12]) *Peacekeeping (range AORs 0.84 [95% CI 0.51-1.38] and 0.82 [95% CI 0.47-1.43]) *Purposely injured, tortured, or killed (range AORs 3.59 [95% CI 1.60-8.06] and 2.69 [95% CI 1.09-6.61]) *Witnessing atrocities (range AORs 1.97 [95% CI 1.17-3.31] and 1.68 [95% CI 0.94-3.01]) - Accident or other unexpected trauma: <ul style="list-style-type: none"> *Auto accident (range AORs 1.07 [95% CI 0.64-1.80] and 0.91 [95% CI 0.50-1.68]) *Other accident (range AORs 1.78 [95% CI 1.06-2.99] and 1.59 [95% CI 0.90-2.81]) 	Fair
