Notes: (A) Scatter plot of predicted and observed gene list inclusion, where perfect predictions would follow a 45 degree line. (B) Histogram of predicted gene list inclusion for 1,750 genes.

TABLE S1: INCLUSION CRITERIA

Program name	Inclusion criteria
BabyDetect	Six mandatory criteria
	1. Disease has to start in pediatric age (<5yo)
	2. Severe, significant disability if not treated
	3. Approved treatment or trial
	4. Good technique
	5. Clear pathogenic mutations
BabyScreen+	6. Highly penetrant mutations
	Four mandatory criteria
	1. Screening can be performed with confidence using currently available technology
	2. The condition associated with the gene has a serious impact on health and/or is life-limiting
	3. The condition associated with the gene usually affects children under 5 years of age
BeginNGS	4. There is available treatment that prevents, cures or significantly reduces the severity of the condition
	Two mandatory criteria
	1. Severe, childhood-onset disease
Chen et al. 2023	2. Effective therapeutic intervention available
	One of the following criteria
	A. Diseases in the current NBS program in China
	B. Diseases on the first national list of rare diseases in China
	C. Diseases on the list of major rare diseases in Shanghai (2016 Edition)
	D. Diseases in the NBS program recommended by the American College of Medical Genetics and Genomics
Generation Study	E. Treatable inherited disorders with a high carrier frequency in Southeast Asia
	Four mandatory criteria
	1. There is strong evidence that the genetic variant(s) causes the condition and can be reliably detected
	2. A high proportion of individuals who have the genetic variant(s) would be expected to have symptoms that would have a debilitating impact on quality of life if left undiagnosed
	3. Early or pre-symptomatic intervention for the condition has been shown to lead to substantially improved outcomes in children, compared to intervention after the onset of symptoms
	4. Conditions screened for are only those for which the interventions are equitably accessible for all

Notes: Inclusion criteria employed by various programs for selecting gene-disease associations for genomic newborn screening, as documented in their published materials.

TABLE S2: GENE-DISEASE CHARACTERISTIC DESCRIPTIONS

Number of Gene-					
Name of Dataset	Disease Pairs	Characteristic	Values	Description	Source
ASQM	747	ASQM score	0-15	Total score of ratings on severity, likelihood, efficacy, acceptability and knowledge	Milko et al. 2019; DeCristo et al. 2021
		NC Nexus category	1	Pediatric conditions with high actionability	
			2	Pediatric conditions with low or no actionability	
			3	Adult conditions with high actionability	
			4	Adult conditions with low or no actionability	
		Severity	0-3, recoded to 0-1	Rating to question "What is the effect on morbidity or mortality to an individual carrying a pathogenic variant in this gene?"	
		Likelihood	0-3, recoded to 0-1	Rating to question "What is the chance that a threat will materialize?"	
		Efficacy	0-3, recoded to 0-1	Rating to question "How effective are interventions for preventing the harm?"	
		Acceptability	0-3, recoded to 0-1	Rating to question "How acceptable are the interventions in terms of the burdens or risks placed on the individual?"	
		Knowledge	0-3, recoded to 0-1	Rating to question "What is the evidence base for decisions about the natural history of the disease, and interventions used for preventing serious outcomes?"	
		Inheritance	Autosomal dominant, recessive, x-linked, or other		
		Age of Onset	Adolescent/adult	Disease presents at age 11 and beyond	
			Childhood	Disease presents at age 2 to 10	
			Infant/neonatal	Disease presents between birth and age 2	
			Birth	Disease presents at birth	
BabySeq	1,390	BabySeq category	A	Genes included in the newborn genomic sequencing report with definitive or strong evidence to cause a highly penetrant childhood-onset disorder	Ceyhan et al. 2017
			B	Genes included in the newborn genomic sequencing report based on actionability during childhood	
			C	Genes that did not meet criteria to be returned in the newborn genomic sequencing report	
		Evidence	Conflicting, limited , moderate, strong, definitive, or no evidence	Evidence that the gene has a causal role in disease	
		Penetrance	High	≥80% of individuals were symptomatic	
			Moderate	20-80% of individuals were symptomatic	
			Low	<20% of individuals were symptomatic	
		Inheritance	Autosomal dominant, autosomal recessive, autosomal recessive digene, complex inheritance, imprinting, mitochondrial inheritance, unknown inheritance, x-linked dominant, x-linked recessive		
		Gold et al. 2023	649	Recommendation fraction	
Prevalence	Disease frequency per 100,000			Disease frequency per 100,000	
Existence of orthogonal test	Yes/No			Existence of an orthogonal test

Notes: Coefficients and associated standard errors of 26x8 linear regressions with as dependent variable the inclusion (either 0 or 1) of a gene in a specific program. In each regression, there are three independent variables: the two RUSP categories, and one of the eight gene-disease characteristics (or expert recommendation proportion) listed here.

Notes: This list of genes is sorted by (1) observed list inclusion and (2) predicted list inclusion. Predicted list inclusion is the average of a linear regression prediction and a random forest prediction, and is based on variables including clinical category, penetrance, age of onset, evidence base, acceptability and efficacy of treatment, disease severity, existence of an orthogonal test, and expert recommendation proportion. The gene-disease pairs which are not listed on OMIM or Clingen are denoted with an asterix.
