

**The impact of public health interventions on the future prevalence
of ESBL-producing *Klebsiella pneumoniae*:
a population based mathematical modelling study**

Luisa Salazar-Vizcaya, et.al

Model equations

$$\begin{aligned}\dot{S}_l^n &= (-1)^\eta \left(\theta_h(t) S_{l=community}^n - \mu_h S_{l=hospitals}^n \right) - \frac{1}{N_l} \beta_l \left(r_l^n + v_{inf}(r_l^a + \kappa r_l^a) \right) S_l^n - \sum_{at} T'_{l,at}(t) \omega S_l^n + \sum_k T'_{l,2}(t) \lambda (r_l^n + r_l^{a,k}) \\ &\quad + \alpha_l (S_l^a + \sum_{at=1,2} r_{l,at}^n + \sum_{at=1,2} r_{l,at}^a) - \epsilon(t) S_l^n + \lambda \left(\left(\frac{1}{2} \right)^\eta T'' - \phi_l \right) r_l^a \\ \dot{S}_l^a &= (-1)^\eta \left(\theta_h(t) S_{l=community}^a - \mu_h S_{l=hospitals}^a \right) - \frac{1}{N_l} \beta_l \left(r_l^n + v_{inf}(r_l^a + \kappa r_l^a) \right) S_l^a v_a + \sum_{at} T'_{l,at}(t) \omega S_l^a \\ &\quad - \alpha_l S_l^a - \epsilon(t) S_l^a v_s \\ \dot{r}_l^n &= (-1)^\eta \left(\theta_h(t) r_{l=community}^n - \mu_h r_{l=hospitals}^n \right) + \frac{1}{N_l} \beta_l \left(r_l^n + v_{inf}(r_l^a + \kappa r_l^a) \right) S_l^n - \sum_{at} T'_{l,at}(t) \omega r_l^n - T'_{l,2}(t) \lambda r_l^n \\ &\quad - \alpha_l r_l^n + \epsilon(t) S_l^n \\ \dot{r}_l^{a,k=1} &= (-1)^\eta \left(\theta_h(t) S_{l=community}^a - \mu_h r_{l=hospitals}^{a,k=1} \right) + \sum_{at} T'_{l,at}(t) \omega r_l^n \kappa - T'_{l,2}(t) \lambda r_l^{a,k=1} \\ &\quad - \alpha_l r_l^{a,k=1} - \lambda \left(\left(\frac{1}{2} \right)^\eta T'' - \phi_l \right) r_l^{a,k=1} \\ \dot{r}_l^{a,k=0} &= (-1)^\eta \left(\theta_h(t) S_{l=community}^a - \mu_h r_{l=hospitals}^{a,k=0} \right) + \frac{1}{N_l} \beta_l \left(r_l^n + v_{inf}(r_l^a + \kappa r_l^a) \right) S_l^a v_a + \sum_{at} T'_{l,at}(t) \omega r_l^n (1 - \kappa) - T'_{l,2}(t) \lambda r_l^{a,k=0} \\ &\quad - \alpha_l r_l^{a,k=0} + \epsilon(t) S_l^a\end{aligned}$$

Where:

- Superindices n and a indicate normal and amplified susceptibility or infectiousness
- Subindices l indicate location (setting), $l = \{community, hospitals\}$
 - $\eta = \begin{cases} 0, & \text{if } l = hospitals \\ 1, & \text{if } l = community \end{cases}$
- $\kappa = 1$ indicates resistance associated with erroneous treatment of an infection associated with

ESBL-producing *Klebsiella pneumoniae*
