Genomic location of DMC that met an adjusted P value < 0.4. OR, 95% CI, and p-values were computed against the general distribution of the 3,870,251 CpGs of our dataset using GraphPad Prism. OR indicate enrichment or depletion of DMCs in each region.

**Figure S1.** Manhattan plot of association of differential DNA methylation with SSc. Each point represents a CpG ( $n=3,870,251$ ) with the chromosomal position along the x-axis and the  $-\log_{10}(P)$  value) on the y-axis. The red line corresponds to a Bonferroni corrected genome-wide significance level of  $1.0 \times 10^{-8}$ .
