

## SUPPLEMENTARY MATERIALS

### Supplementary Material A – Variable definition

Appointment attendance, consultation medium and ethnicity were grouped based on theoretical grounds. Appointment attendance was classified on the basis on patients having clinical contact, with cancellation groupings remaining the same. Consultation medium was classified on the basis on appointments taking place in person or remotely, with a separate level when it was not possible to determine this distinction. Ethnicity was divided into majority and minority ethnic groups. Referral source was reduced on the basis on available data points for each level, retaining the original labels for the two primary referral sources. Missing data was labelled as unknown if there was no entry recorded or the data entry indicated that the measurement was not available.
