

## SUPPLEMENTARY INFORMATION

### SUPPLEMENTARY NOTE:

- a. Members of the Japanese Research Committee on Idiopathic Osteonecrosis of the Femoral Head ----- P2
- b. Acknowledgement ----- P3
- c. Web resources ----- P5

### SUPPLEMENTARY FIGURES:

**Supplementary Figure 1:** Quantile-quantile (QQ) plot of the meta-analysis association *P* values for all variants (left) and the variants outside of known SLE loci (right). ----- P6

**Supplementary Figure 2:** Regional association plots for the 113 SLE genomic loci. ----- P7

**Supplementary Figure 3:** Expression quantitative trait locus (eQTL) effect of rs66977652 on *SMG7* gene across a range of human tissues/cells in GTEx v8. ----- P28

**Supplementary Figure 4:** Tissues (a) and cells (b) in which the expression of genes within SLE-associated loci are significantly enriched in DEPICT analysis. ----- P29

**Supplementary Figure 5:** Schematic diagram of luciferase expression vector constructs. ----- P30

**Supplementary Figure 1.** Quantile-quantile (QQ) plots of the meta-analysis association  $P$  values for all variants (left) and the variants outside of known SLE loci (right). X-axis is the minus  $\log_{10}$ -transformed expected  $P$  values while the y-axis is the minus  $\log_{10}$ -transformed observed  $P$  values in the meta-analysis. The genomic control inflation factor ( $\lambda_{gc}$ ) is shown in the top of each figure.

**Supplementary Figure 2.** Regional association plots for the 113 SLE genomic loci. Each circle represents a variant that is plotted with its minus  $\log_{10}$ -transformed association  $P$  value and chromosomal position. Recombination rates are estimated from the International HapMap Project data, and gene annotations are taken from the hg19 UCSC Genome Browser. The SLE loci were numbered based on chromosomal position as from “region 1” to “region 113”. The first 85 loci (such as region 1, region 6, and region 7) display single lead variants as purple diamonds. The other non-lead variants were colored by  $r^2$  values with the lead variant (estimated from 7,021 unrelated Chinese controls). The following remaining 28 loci with multiple distinct association signals (such as region 2, region 3, and region 4) highlight variants associated with the first, second, third, and fourth distinct signals in red, blue, green, and purple, respectively. The lead variant for each distinct association signal were represented as diamond. For *HLA* (region 41) and 7q11.23 (region 50), we show regional plots using the most significant single variants.

**Supplementary Figure 3: Expression quantitative trait locus (eQTL) effect of rs66977652 on SMG7 gene across a range of human tissues/cells in the GTEx v8 (<https://www.gtexportal.org>).** Samples: the study sample size for each of the tissues. NES: normalized effect size. M-value is a posterior probability to quantify the association between rs66977652 and SMG7 expression that was estimated in a Bayesian tool METASOFT ([http://genetics.cs.ucla.edu/meta\\_jemdoc/](http://genetics.cs.ucla.edu/meta_jemdoc/)). The rotated box plot shows the eQTL effect size and its 95% confidence interval in each tissue separately.

**Supplementary Figure 4. Tissues (a) and cells (b) in which the expression of genes within SLE-associated loci are significantly enriched.** Y-axis denotes the minus  $\log_{10}$ -transformed enrichment  $P$  values. The tissues and cells significantly more expressing SLE-locus genes are colored in orange.

**Supplementary Figure 5. Schematic diagram of luciferase expression vector constructs.** To test the allele-specific enhancing activity of rs61759532, three constructs were used by adding no inserts (top; None) and three identical copies of the 24bp element around C alleles (middle; 3xC) or T alleles (bottom; 3xT) into the upstream of the minimal promoter (denoted as P) of the firefly luciferase gene of the luciferase vector (pGL4.26).
