

Fig. S2 INPP5E protein alignment in 100 different species. Evolutionarily conserved residues are indicated at the bottom of the alignment by using the symbols period (.), colon (:), and asterisk (*), consistent with increasing conservation. Clustal Omega predicted domain (residues 297-599 of human INPP5E) is indicated by a dark green bar and it overlaps with the Pfam-predicted phosphatase domain (residues 304-584). However, due to the significant conservation of region encompassing residues 273-296 and 600-621, we redefined the length of the INPP5E functional domain and indicated it by a light green bar. Residues mutated in the IRD probands presented in this study are highlighted in bold red.
