## **Supplementary Methods**

### **Additional Information on Participants**

The Alzheimer's Disease Genetics Consortium (ADGC) is a multicenter consortium aiming to identify genetic risk factors for Alzheimer's disease (AD) (Naj et al., 2011). Study protocols for all cohorts were reviewed and approved by the appropriate institutional review boards. Written informed consent was obtained from participants without substantial cognitive impairment, or from authorized legal representatives for those too impaired to give consent. Enrollment criteria differed by cohort but are consistent with generally accepted clinical guidelines. Further information can be found in Kunkle et al. (Kunkle et al., 2019)

### **Sample and Genotype Data Quality Control**

Identity by descent (IBD) was estimated using genotypes imputed to the Haplotype Reference Consortium (HRC) 1.1 reference panel (McCarthy et al., 2016) and KING (Manichaikul et al., 2010). Related individuals (proportion of identity by descent, IBD > 0.1875) within and across all cohorts were removed. PLINK 1.9 (Chang et al., 2015; Purcell et al., 2007; Shaun Purcell) was used for quality control (QC) and for ethnicity determination.

Sample-level QC and QC for genotype-level call-rate (<95%) and heterozygosity (control Hardy-Weinberg Equilibrium  $P<1\times10^{-6}$ ) were performed prior to imputation. Samples with excess or insufficient heterozygosity – greater than three standard deviations from the mean in either direction – were removed. Genotype phasing and imputation were performed using the Michigan Imputation Server (Das et al., 2016) individually for each of 37 cohorts or sub-cohorts, using all ethnicities in the HRC 1.1 reference panel. Eagle was used for phasing (Loh et al., 2016) and Minimac3 was used for imputation. Following imputation, poorly imputed ( $R^2<0.8$ ) or rare ( $MAF<0.01$ ) variants were removed, and the sub-cohorts were merged for joint analysis. The data QC protocol for the Litwin Zucker Alzheimer's Research Center at the Feinstein Institutes for Medical Research (LZ) samples was previously described, utilizing several empirically-determined or consensus filters at the variant, genotype, and sample levels (Adelson et al., 2019).

After merging ADGC imputation data and LZ data, variants with low call rate (<95%) were removed, and additional samples with call rate <95% were removed. Additional QC was applied to remove variants with differential missingness between controls and cases at  $P<1\times10^{-4}$ .

### **Principal Component Analysis**

Principal component analysis (PCA) was performed using PLINK 1.90 (Chang et al., 2015; Shaun Purcell) on linkage disequilibrium-pruned variants with minor allele frequency  $\geq 5\%$ . PCA was used to remove any samples more than six standard deviations from the mean eigenvector for any of the first ten principal components (PCs), using the 1000 Genomes Project Phase 3 European superpopulation as a reference (Auton et al., 2015).

### **Polygenic Risk Score (PRS) Estimation**

A PRS is calculated per person,  $i$ , and the number of included single nucleotide polymorphisms (SNPs,  $j$ ) depends on parameters such as the GWAS significance threshold and thresholds for pruning for linkage disequilibrium (LD) (Misganaw et al., 2019).

$$PRS_i = \sum (\beta_j * SNP_{ij}).$$

We used the software PRSice-2 (Choi and O'Reilly, 2019; Euesden et al., 2015) to calculate and optimize PRS using P-value thresholding. Summary statistics from 17,008 AD cases and 37,154 controls from the International Genomics of Alzheimer's Project (IGAP) genome-wide association study (GWAS) meta-

analysis (Lambert et al., 2013) were used as base data to avoid sample overlap, since the larger AD meta-analysis from Kunkle et al. (Kunkle et al., 2019) includes the ADGC samples used in this study.

To calculate PRS without *APOE* (PRS<sub>non-*APOE*</sub>), we excluded variants within 750 kilobases from the start or end of the *APOE* gene (chr19:44659011- 46162650, GRCh37). The summary statistics from the IGAP GWAS were linkage disequilibrium pruned at a threshold  $r^2 > 0.1$  within 250-kilobase windows. *APOE* genotype (2/2, 2/3, 2/4, 3/3, 3/4, and 4/4, with one removed as the contrast), based on rs429358 and rs7412, along with eigenvectors of ten PCs and sex were included as covariates for PRS optimization.

Calculating PRS<sub>non-*APOE*</sub> using the two control sets resulted in identical optimal P-value thresholds ( $P_T$ ) for the most predictive PRS at  $P_T = 1 \times 10^{-5}$ . The PRS at this  $P_T$  is based on 92 SNPs associated with AD at a genome-wide significant level or suggestive level in the IGAP summary statistics (Lambert et al., 2013). This PRS model explains 1.5% of the phenotypic variation ( $R^2$ ) in our cohort using either control set, based on the Nagelkerke pseudo- $R^2$  estimate (Nagelkerke, 1991). This PRS model was significantly associated with AD status when compared with the 90+ control-set alone ( $P=1.3 \times 10^{-6}$ ) as well as all ADGC controls ( $P=2.5 \times 10^{-14}$ ). Although both control-sets resulted in the same optimal  $P_T$  for PRS, the predictive performance of variants with weak association signals was reduced when 90+ controls were used (**Supplementary Figure 2**). To allow for comparison to previous publications, we also calculated PRS that included the *APOE* SNPs rs429358 and rs7412.

### **Supplementary Table 1. Characteristics of Study Participants in ADGC and LZ.**

Details about AD cases and controls included in the 13 cohorts from the ADGC and the cohort from the LZ at Northwell Health. For each cohort, these details include the number of participants (*N*), the percentage of participants who are female (% female), and the mean AAO for AD cases and mean AAE for controls. For ADGC cases, age is defined as AAO as reported by the study (*n*=1,574). If AAO is not reported, we estimated AAO by subtracting ten years from age at death (AAD, *n*=102) and for those without AAD, age at last examination (AAE) is used (*n*=57). For the ADGC controls, AAE is used (*n*=2,995) and AAD is used for a small proportion of controls (*n*=126). For the LZ cohort, age is reported as age at enrollment for cases (*n*=27), and as AAE for controls (89-: *n*=35, 90+: *n*=120). The total sample utilized in this study includes 1,760 AD cases (60-99 years), 2,930 89+ controls, and 346 90+ controls.

## Supplementary Figure 1. Flowchart of Data Preparation and Analyses.

## **Supplementary Figure 2. Determination of the P-Value Threshold for PRS Optimization**

Results of clumping and thresholding.  $R^2$  explained by PRS was calculated at IGAP GWAS P-values from  $5 \times 10^{-8}$  to 1. The solid line shows standard  $R^2$ , when all ADGC controls were defined as controls, and the dotted line indicates superager  $R^2$ , when only superagers (controls age 90 years or older) were defined as controls for PRS optimization. In both calculations, the optimal P-value threshold to maximize  $R^2$  was  $10^{-5}$ , which explained 1.5% of phenotypic variance.

**Abbreviations:** ADGC, Alzheimer's Disease Genetics Consortium; GWAS, genome-wide association study; IGAP, International Genomics of Alzheimer's Project; PRS, polygenic risk score;  $R^2$ , variance explained.

### Supplementary Figure 3. ROC Curves for AD Risk Models.

We calculated AUC for the receiver operating characteristic (ROC) curve for predicting case status with the two control groups. **(a)** ROC curves were generated for two separate models of AD risk: a standard model using all ADGC controls, and a model using only superagers (controls age 90 years or older). PRS<sub>non-APOE</sub> is not significantly more predictive ( $P=0.067$ ) for 90+ controls (AUC=0.60) than all ADGC controls (AUC=0.57). The dotted line represents AUC=0.50. **(b)** Same models as **(a)**, except that PRS includes the *APOE4* and *APOE2* genotypes, 90+ controls shows significantly higher AUC (0.74 vs. 0.67,  $P=4.2 \times 10^{-6}$ ).

**Abbreviations:** AD, Alzheimer's disease; ADGC: Alzheimer's Disease Genetics Consortium; AUC, area under the curve; PRS<sub>non-APOE</sub>, APOE-independent polygenic risk score; ROC, receiver operating characteristic.

## Supplementary Figure 4: Kaplan-Meier Survival Analysis using the PRS<sub>non-APOE</sub> Stratified by APOE4 Carrier Status.

To visualize the effect of PRS<sub>non-APOE</sub> on AAO in APOE4 carriers and non-carriers, we performed a Kaplan-Meier survival analysis, censoring controls (represented by + signs on the plot). This Kaplan-Meier curve appears to be comparable with previous publication (Desikan et al., 2017). We performed a Cox Proportional Hazards (Cox-ph) analysis of PRS quantile (Middle 80%, bottom 10% and top 10%), APOE4 carrier status, and the interaction between the two, covarying for the top two PCs and stratified by cohort. Overall, PRS quantile ( $P=2.9 \times 10^{-9}$ ) and APOE4 carrier status ( $P=9.1 \times 10^{-13}$ ) were highly significant in an analysis of deviance, but the interaction was nonsignificant. Compared to the middle 80% of the PRS<sub>non-APOE</sub> distribution, subjects with PRS<sub>non-APOE</sub> in the bottom decile have a 38% reduction in AD hazard (Cox Proportional Hazard Ratio, HR=0.62 and  $P=1.9 \times 10^{-3}$ ) and those in the top decile have a 29% increased risk (HR=1.29 and  $P=2.4 \times 10^{-2}$ ). APOE4 carrier status was significant in the Cox-ph model as expected (HR=3.19,  $P=2.0 \times 10^{-9}$ ). The APOE effect should be interpreted cautiously because it tests as non-proportional in the "cox zph test", which would be a violation of the assumptions of the Cox-ph model.

**Abbreviations:** APOE4, Apolipoprotein E-ε4 allele; PRS, polygenic risk score. Bottom 10% of PRS: bottom 10% PRS<sub>non-APOE</sub> distribution of all samples. Top 10% of PRS: top 10% PRS<sub>non-APOE</sub> distribution of all samples.

## **Ethics Statements**

This study conducted a secondary analysis of de-identified datasets and is not considered human subjects research according to the institutional review board (IRB) at Northwell Health. DNA samples were collected by multiple agencies with written informed consent in accordance with protocols approved by the local IRBs at Montefiore Medical Center and the Committee on Clinical Investigation at the Albert Einstein College of Medicine, Northwell Health, and participating centers of the Alzheimer's Disease Genetics Consortium (ADGC) founded by the National Institute on Aging.

41. Neurogenetics Program, University of California Los Angeles, Los Angeles, California
42. Department of Pathology and Laboratory Medicine, Indiana University, Indianapolis, Indiana
43. Department of Neurology, Emory University, Atlanta, Georgia
44. Department of Neurology, Massachusetts General Hospital/Harvard Medical School, Boston, Massachusetts
45. Department of Pathology (Neuropathology), University of Pittsburgh, Pittsburgh, Pennsylvania
46. Department of Neurology, University of Alabama at Birmingham, Birmingham, Alabama
47. Sanders-Brown Center on Aging, Department of Molecular and Biomedical Pharmacology, University of Kentucky, Lexington, Kentucky
48. Taub Institute on Alzheimer's Disease and the Aging Brain, Department of Neurology, Columbia University, New York, New York
49. Department of Pathology, Duke University, Durham, North Carolina
50. Department of Genome Sciences, University of Washington, Seattle, Washington
51. Department of Medicine (Medical Genetics), University of Washington, Seattle, Washington
52. Sanders-Brown Center on Aging, Department Neurology, University of Kentucky, Lexington, Kentucky
53. Department of Pathology and Laboratory Medicine, University of California Davis, Sacramento, California
54. Department of Biology, Brigham Young University, Provo, Utah
55. Department of Neurology, Oregon Health & Science University, Portland, Oregon
56. Department of Neurology, Portland Veterans Affairs Medical Center, Portland, Oregon
57. Department of Pathology and Laboratory Medicine, University of California Irvine, Irvine, California
58. Department of Neurology, Boston University School of Medicine, Boston, Massachusetts
59. Department of Pathology, Boston University School of Medicine, Boston, Massachusetts
60. Department of Neuropsychology, University of California San Francisco, San Francisco, California
61. Department of Molecular & Medical Genetics, Oregon Health & Science University, Portland, Oregon
62. Department of Neurobiology and Behavior, University of California Irvine, Irvine, California
63. Department of Pathology, University of Washington, Seattle, Washington

- 64. Department of Psychiatry and Behavioral Sciences, University of Washington, Seattle, Washington
- 65. Department of Pathology, University of Michigan, Ann Arbor, Michigan
- 66. Department of Psychiatry, Johns Hopkins University, Baltimore, Maryland
- 67. Department of Preventive Medicine, University of Southern California, Los Angeles, California
- 68. Department of Medicine - Pulmonary, New York University, New York, New York
- 69. Department of Pathology, University of California San Diego, La Jolla, California
- 70. Department of Medicine, University of Washington, Seattle, Washington
- 71. School of Nursing Northwest Research Group on Aging, University of Washington, Seattle, Washington
- 72. Cognitive Neurology and Alzheimer's Disease Center, Northwestern University, Chicago, Illinois
- 73. Department of Pathology, University of Southern California, Los Angeles, California
- 74. Department of Pathology and Laboratory Medicine, University of California Davis, Sacramento, California
- 75. Department of Neurology, Washington University, St. Louis, Missouri
- 76. Department of Medical and Molecular Genetics, Indiana University, Indianapolis, Indiana
- 77. Department of Neurology, University of California Davis, Sacramento, California
- 78. Department of Biostatistics, Mayo Clinic, Rochester, Minnesota
- 79. Department of Anatomic Pathology, Mayo Clinic, Mayo Clinic, Rochester, Minnesota
- 80. Department of Laboratory Medicine and Pathology, Mayo Clinic, Rochester, Minnesota
- 81. Department of Neurology, Mayo Clinic, Rochester, Minnesota
- 82. USF Health Byrd Alzheimer's Institute, University of South Florida, Tampa, Florida
- 83. Arizona Alzheimer's Consortium, Department of Psychiatry, University of Arizona, Phoenix, Arizona
- 84. Banner Alzheimer's Institute, Phoenix, Arizona
- 85. Alzheimer's Disease Center, New York University, New York, New York
- 86. Department of Neurology, University of Texas Southwestern, Dallas, Texas
- 87. Department of Psychiatry, Mount Sinai School of Medicine, New York, New York
- 88. Department of Radiology and Imaging Sciences, Indiana University, Indianapolis, Indiana
- 89. Department of Pathology (Neuropathology), Rush University Medical Center, Chicago, Illinois
- 90. Department of Psychiatry, University of Southern California, Los Angeles, California
- 91. Department of Pathology and Laboratory Medicine, University of Pennsylvania, Perelman School of Medicine, Philadelphia, Pennsylvania
- 92. Department of Pathology, Johns Hopkins University, Baltimore, Maryland
- 93. Sanders-Brown Center on Aging, Department of Anatomy and Neurobiology, University of Kentucky, Lexington, Kentucky
- 94. Department of Pathology & Laboratory Medicine, University of California Los Angeles, Los Angeles, California
